15 Best Practices / Tips	209

1 Overview

1.1 Purpose

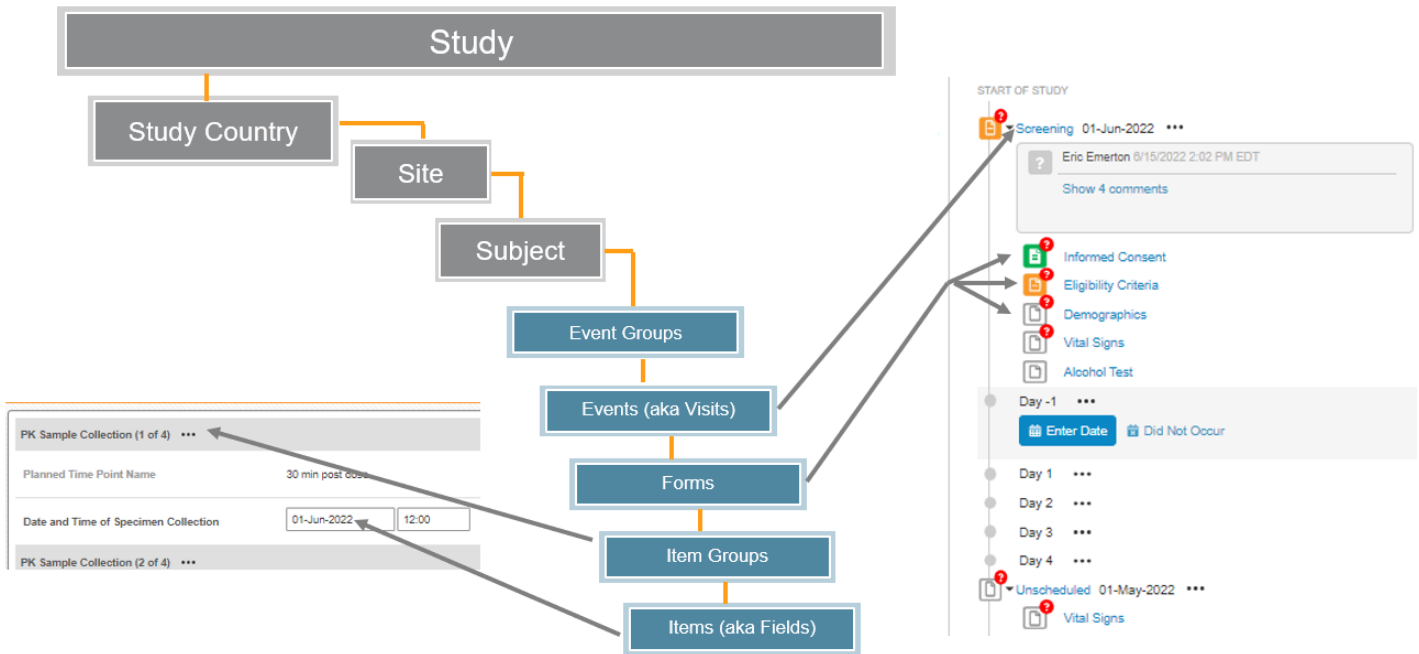

This document serves as an extended guide, supplemental to the API developer website for Veeva Vault CDMS API. Best practices, cause/effect examples are given here, whereas the online help is quicker reference with typically few/one example(s). Refer to the **Best Practices** chapter at the end of this document, and **TIP** entries are also given inline with the examples.

1.2 Reference URLs

https://developer-cdms.veevavault.com/api/22.2/	<p>As of Veeva Vault release 22.2, this is the main CDMS API reference (subjects, events, forms, etc.)</p> <p>NOTE: As new major Vault CDMS releases occur (April, August, December each year), the documentation link for newer API version is the same, but with new XX.Y (year.release number)</p>
https://developer.veevavault.com/	<p>General home page for Veeva Vault developers</p>
https://developer.veevavault.com/docs/#rest-api	<p>Quick start guide for general Veeva Vault API</p>
https://developer.veevavault.com/api/22.2/	<p>Platform Vault API reference as of this release. General Vault concepts used by any vault application (logs, FTP, documents, etc.) are outlined</p>

1.3 CDMS Hierarchy

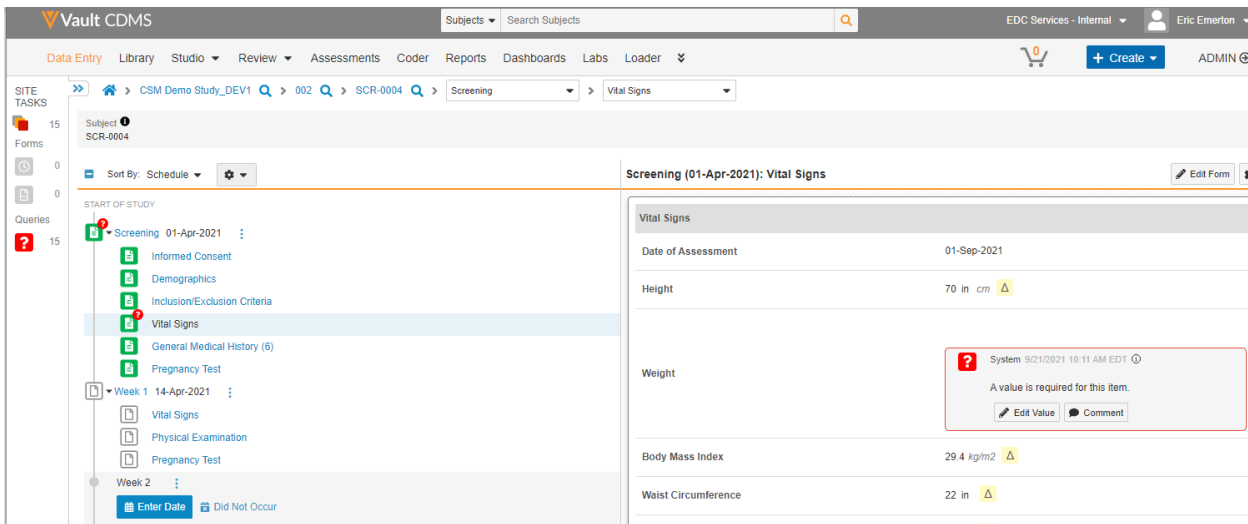

The CDMS data hierarchy / terminology is summarized by:

- Access within a study follows the **Study Country -> Site** hierarchy, i.e. which **sites** a user can see. A Data Manager might have access to all, a regional CRA some countries but not all, and site users just their specific site
- Once in a subject, the components of data follow largely an ODM CDISC model (Visits/Forms/Item Groups/Items), where 'Event' = 'Visit'. There is an additional layer for Event Groups to cover repeating cycles of events/visits as one unit.

Referring to the below UI example...

- Study = **CSM Demo Study_DEV1**
- Study Country = (not pictured, **United States**, a relationship to the site)
- Site = **002**
- Subject = **SCR-0004**
- Event Group = (not pictured). A group of events (aka visits) are organized into an event group to better facilitate repeating cycles, unscheduled events.
- Event = **Screening**
- Form = **Vital Signs** (details, right side of screen)
- Item Group = **Vital Signs** (group of fields on a CRF, used for repeating when necessary)
- Items = **Date of Assessment** (date field), **Weight** (unit codelist field), etc.

- **WARNING:** The pictured elements in the EDC UI are **LABELS**, not the parameters necessary to interact through the API. The CDMS API operates with design **NAMES** for push of data in, and has a few (albeit) rare cases where labels are returned.
- Depending on the API endpoint these components are usually required to identify the subject, then the location in the casebook / CRFs of the subject. Some endpoints allow a 'by ID' update, the internal Vault ID, instead of a Study Country / Site / Subject / Event Group / Event... combination. (but not all)
- How does one get the proper parameters for these design elements? The team that built the study should relay this information via **Study Design Specifications (SDS)** document generated from the Vault CDMS **Studio** module. At later API releases, there will be a design level API to get this information of names <-> labels, plus supporting properties at all design levels, and for each casebook definition.
- Continuing with the example pictured above, the **SDS (workbook)** -> **Schedule – Tree** tab of the SDS:

A	B	C	D	E	F	G	H	I
Casebook	Event Group	Event Group Name	Event	Event Name	Form	Form Name	Restrict	Repeat
1	Screening	eg_SCREENING						No
1	Screening	eg_SCREENING	Screening	ev_SCREENING				No
1	Screening	eg_SCREENING	Screening	ev_SCREENING	Informed Consent	IC	No	No
1	Screening	eg_SCREENING	Screening	ev_SCREENING	Demographics	DM	No	No
1	Screening	eg_SCREENING	Screening	ev_SCREENING	Inclusion/Exclusion Criteria	IE	No	No
1	Screening	eg_SCREENING	Screening	ev_SCREENING	Vital Signs	VS	No	No
1	Screening	eg_SCREENING	Screening	ev_SCREENING	General Medical History	MH	No	Yes
1	Screening	eg_SCREENING	Screening	ev_SCREENING	Pregnancy Test	LB_PREG	No	No
1	Treatment	eg_TREATMENT						No
1	Treatment	eg_TREATMENT	Week 1	ev_WEEK1				No
1	Treatment	eg_TREATMENT	Week 1	ev_WEEK1	Vital Signs	VS2	No	No
1	Treatment	eg_TREATMENT	Week 1	ev_WEEK1	Physical Examination	PE	No	No

...tells us the Event Group, Event, Form design names for the example given.

- Event Group = **eg_SCREENING**
- Event = **ev_SCREENING**
- Form = **VS**
- Item group design names, item design names are then found on the Form Definitions tab:

F	G	H	I	J	K	L	M	N	O	P	Q
Item Group	Item Group Label	IG Re	Header Visible	Visual	RM	IG	Item Name	External ID	Label	Data Type	Require
VS	Vital Signs	No	Yes	Yes				VS			
VS	Vital Signs						VSDAT_2	VSDAT	Date of Assessment	Date	Yes
VS	Vital Signs						HEIGHT	HEIGHT	Height	Unit	Yes
VS	Vital Signs						WEIGHT	PL_WEIGHT	Weight	Unit	Yes
VS	Vital Signs						BMI	BMI	Body Mass Index	Number	Yes
VS	Vital Signs						WSTCIR	WSTCIR	Waist Circumference	Unit	Yes
VS	Vital Signs						VSPOS	VSPOS	Position	Codelist	Yes
VS	Vital Signs						SYSBP	SYSBP	Systolic Blood Pressure	Number	Yes
VS	Vital Signs						DIABP	DIABP	Diastolic Blood Pressure	Number	Yes
VS	Vital Signs						HR	HR	Heart Rate	Number	Yes
VS	Vital Signs						RESP	RESP	Respiratory Rate	Number	Yes
VS	Vital Signs						TEMP	TEMP	Body Temperature	Unit	Yes
MH	General Medical History	No	Yes	Yes				MH			

...which indicates:

- Item Group = **VS**
- Items = **VSDAT_2, HEIGHT, WEIGHT, BMI...**

1.4 CDMS API Summary

- The Vault API is REST based. The vast majority of the API endpoints use URL parameters or JSON request bodies, return JSON response bodies (unless a file or log download)
- General vault API includes a JSON return structure like:

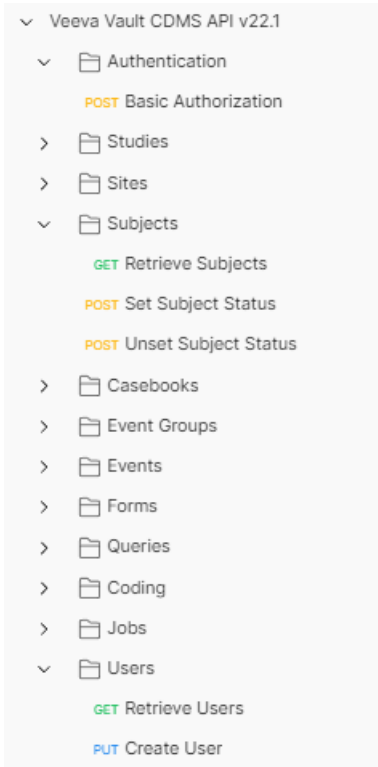

```
1 {
2   "responseStatus": "SUCCESS",
3   "responseDetails": {
4     "pagesize": 1000,
5     "pageoffset": 0,
6     "size": 131,
7     "total": 131
8   },
9   "data": [
```

.. with **responseStatus** returning the overall request status. Most Vault APIs have paging, with total, limit, offset, and URLs to the 'next' / 'previous' page of data (of a query/request).

- CDMS API endpoints are very 1 to 1 with the actions / buttons seen in the UI. As example, if the intent is to add a subject, plus data to some forms in a screening visit, then APIs must be called for each of (potentially) - (a) Add subject (b) Set subject status (c) Set event date (first event for subject) (d) Set of data on form (with add item groups on the form if/when necessary (e), Finally the submit of the form. The sequencing of these calls is vitally important. Currently, many actions are not rolled into fewer API calls, via parameters. (e.g., set data on a form, plus submit it, as one call). Consolidated API calls to accomplish multiple actions are in consideration for future releases all the time.
- CDMS specific errors – most examples are here: <https://developer-cdms.veevavault.com/api/22.2/#errors-cdms>

1.5 Postman Collection

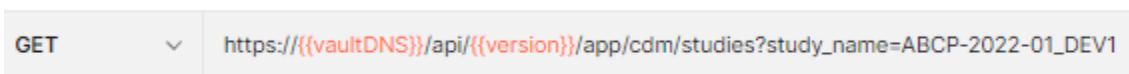

Any REST endpoint tool can be used for experimenting as part of API development. This guide will show examples using Postman. Each API release includes a Postman collection, downloadable from the developer API website. As example of a postman collection:

The use of a postman collection requires setting of an environment profil:

... to change between variables with in the collection, e.g. `{{vaultDNS}}` below (the URL for your vault), `{{version}}` (e.g. **v22.2** for this release):

If your vault URL is, as example, **https://edc-services-internal.veevavault.com/...** , then the portion **edc-services-internal.veevavault.com** is what is used for the vaultDNS variable above.

Further, your username / password to the vault are environment variables used in the Authentication endpoint:

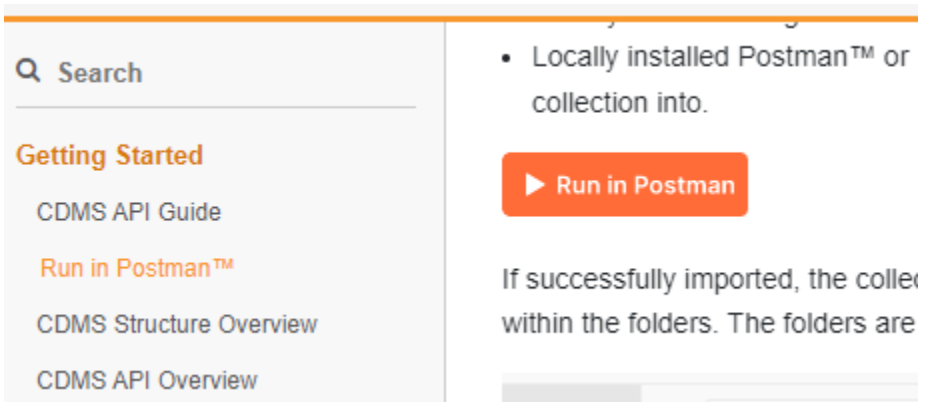

POST ▼ <https://{{vaultDNS}}/api/{{version}}/auth>

Params Authorization Headers (11) **Body** ● Pre-request Script Tests ● Settings

none
 form-data
 x-www-form-urlencoded
 raw
 binary
 GraphQL

KEY	VALUE
<input checked="" type="checkbox"/> username	{{username}}
<input checked="" type="checkbox"/> password	{{password}}

The postman collection can be imported from the help website, **Run in Postman** section:

Q Search

Getting Started

- CDMS API Guide
- Run in Postman™**
- CDMS Structure Overview
- CDMS API Overview

- Locally installed Postman™ or collection into.

▶ Run in Postman

If successfully imported, the collection will be added within the folders. The folders are

The **Run in Postman** button will lead you through getting the collection imported to your local Postman workspace, or Postman for Web workspace (if you have one).

1.6 Rate Limits / Caveats

- **WARNING:** There are API limits vault wide, as well as by user, to protect the vault. These are general vault platform specific, not necessarily applicable because of Vault CDMS. Earlier releases (< 21R1) have hard limits for each 5-minute window, plus a 24-hour daily limit for all users of the vault. For later versions, vault will slow down response times as the rate limits are hit. There is **also** a limit on the number of API logins in any single calendar minute (20). Do not re-authenticate with each API call. More information at <https://developer-cdms.veevavault.com/api/22.2/#api-rate-limits>
- **WARNING:** Many API returns will include a '**SUCCESS**' at the top level, that is the to/from the server was OK. But the body of the return must be parsed / inspected to see if there are any errors on the attempt. Do not assume top level success for pushing data to CDMS means it was fully successful! Most API actions into the system (update/insert data) are done in batch API requests, so each section should be inspected for its success/failure (not just the overall request status)
- **WARNING:** The CDMS API is built on top of the vault API, which allows raw VQL'ing to any object, fields that the user has rights to read. It is strongly **discouraged** to use raw object retrievals for reverse engineering of the data. Doing so will likely result in a job / code being tripped up at some later release when that data model changes. All attempts should be made to use the formal endpoints for data retrieval / updates into a study.

1.7 API Roles / Access

A user with Security Profile **Vault Owner** can use the API, the entire system in fact, in all ways. Other users are given access just like any other study user, with a specific role in that study. Users with rights to administer study users navigate to the **System Tools** area:

.. from which, one then creates a user (or add/apply an existing user on the Vault domain):

The access granted for a study on new user / apply existing user has multiple options for **Study Access** (2nd part of pictured):

[← Back to Users](#)

New User

Details

Last Name

First Name

User Name @edc-services.com

Email

Federated ID

Security Policy

Add as Principal Investigator Yes No

Study Access

Grant Access to All Studies Yes No

Accessible Studies

No accessible studies

Select a study to configure access

Option A: Access to all studies now, **AND** in the future: (less common)

Study Access

Grant Access to All Studies Yes No

Environment	Grant Access	Role
All Studies	✓	CDMS API Read Write

Option B: Specific study / environment (note the **Access to All Sites = checked**, otherwise specific sites/countries):

Study Access

Grant Access to All Studies Yes No

Accessible Studies [+ Add Studies](#)

Search

CSM Demo Study [Remove Study Access](#)

Grant Access to All Environments and Sites Yes No

Environment	Grant Access	Role	Access to All Sites
CSM Demo Study_DEV1	✓	CDMS API Read Write	<input checked="" type="checkbox"/>

Option C: Use **Grant Access to All Environments and Sites = Yes**. This is equivalent to **Access to All Sites**, but for all instances in the vault for the study. This is most applicable in a UAT vault where there are UAT1, UAT2, UAT3, etc. under one study umbrella. In a production or dev vault it has the same effect as Option B.

CSM Demo Study [Remove Study Access](#)

Grant Access to All Environments and Sites Yes No

Environment	Grant Access	Role	LMS Training Status
All Environments			

TIP: Consider only ever granting an API user the access / studies it needs, when needed for Production. In a UAT / Dev vault, access to all studies, or all instances of a study might be appropriate, unless the API user is for a partner / vendor company (e.g., IRT developing integrations)

WARNING: An API user is no different from any other study user. Typically, users must go through / pass a training before their study access is truly enabled. For an API / system user, ensure to check the Ignore LMS Status, Assume Trained attribute, otherwise the API user won't find the study (or studies) intended

	LMS Training Status	Ignore LMS Status, Assume Trained
		<input checked="" type="checkbox"/>

1.8 Vault Permission Sets / Roles

Vault CDMS resides on the Vault Platform and uses Vault Application Roles and Permission Sets for the basis of what a user can / cannot do. Should a custom role be setup (example: to also access a custom object / area), then the role needs to be setup with the API access permission, usually attainable with Vault CDMS's **Tools -> System Tools -> Role Management** grid, simply ensuring the API Access line checked for the new custom role:

Role Management		Show: <input checked="" type="radio"/> All Roles <input type="radio"/> Active Roles																					
		Administration				Clinical			Coding			Data Management						Other					
		CDMS Deployment Administrator	CDMS Safety Administrator	CDMS Super User	CDMS User Administrator	CDMS CRA with Manage Jobs	CDMS Clinical Research Associate	CDMS Clinical Coder	CDMS Clinical Coder Administrator	CDMS Clinical Coder Manager	CDMS Auditor Read Only	CDMS Data Manager	CDMS Data and Definition Export	CDMS Lab Data Manager	CDMS Lead Data Manager	CDMS Medical Assessment Editor	CDMS Medical Assessment Reader	CDMS API Read Only	CDMS API Read Write	CDMS Librarian	CDMS Randomization Manager	CDMS	
Number of Users		0	0	1	0	1	4	1	0	0	0	0	0	2	0	0	0	0	1	0	0	0	6
Manage Role		▼	▼	▼	▼	⚙️	▼	▼	▼	▼	▼	▼	▼	▼	▼	▼	▼	▼	▼	▼	▼	▼	
View Protocol Deviations			✓			✓	✓				✓	✓			✓							✓	
Edit Protocol Deviations			✓			✓	✓				✓			✓								✓	
API Access			✓	✓							✓			✓			✓	✓	✓				

What follows in the rest of this section is the details on Vault level roles/permission sets. The key to a user being able to use the API on a study (or studies) is a permission set in their study role:

Name	Status	Source	Description
API Access	Active	Standard ▼	CDMS Permission Set for API access

.. is necessary for using the API. This permission set is standard to CDMS and will either be included in a standard CDMS role, or custom CDMS role. The API user then is granted the role, with a study (or studies) as necessary

Should custom permission sets be setup in a vault, the key for API'ing is / are these settings:

Permission Sets >
API Access

Vault Actions									
	All Vault Actions								
Vault Actions									
	All	Read Dashboards and Reports	Create Dashboards	Delete Dashboards	Share Dashboards	Schedule Reports	Administer Dashboards	Display Public Key Dashboards	Read Group Membership
Dashboards and Reports									
	All Workflow	Start	Participate	Read and Understand	eSignature	Query			
Workflow									
	All Workflow Admin	Cancel	View Active	Reassign	Update Participants	Email Participants	Update Workflow Dates	Replace Workflow Owner	
Workflow Administration									
	All API	Access API	Events API	Metadata API					
API		✓		✓					
	Manage Tags	Merge Anchors	Remove Annotations	Manage Anchors					

As well as:

Audit Trail	
	Access
File Staging	✓
	Edit Document Matches
EDL Matching	

Together with base Vault settings for using its API (CDMS or any other Vault application), the other permission sets are CDMS specific. As example, a role **CDMS API Read Write** (custom), has the **API Access** permission set, plus relevant CDMS role

Permission Sets

Name	Description
API Access	CDMS Permission Set for API access
CDMS All Objects Read Only	CDMS Permission Set for Read access to all objects
CDMS Definition Objects Full Access	CDMS Permission Set for full access to Definition objects
CDMS Execution Objects Full Access	CDMS Permission Set for full access to Execution objects
Coder Tab Access	CDMS Permission Set for Coder Tab
Coder Tools Tab Access	CDMS Permission Set for Coder Tools Tab
Data Entry Tab Access	CDMS Permission Set for Data Entry Tab
EDC Tools Tab Access	CDMS Permission Set for EDC Tools Tab

TIP: Consider using the built in API roles (**Standard**) for API users. Custom roles are usually made as clones of a standard role, with additive permissions to other areas, usually custom objects / tabs.

TIP: Consider using a Security Policy in the vault with no password expiration, so that API accounts do not suddenly run into password expiration during their use/runs. Below is a security policy named 'No Password Expiration', with the specific '**No Expiration**' property set.

Security Policies > No Password Expiration

Details

Policy Name No Password Expiration

Description For system accounts

Security Settings

Authentication Type Password

Password Requirements

- Passwords require a number
- Passwords require an upper-case letter
- Passwords require a non-alphanumeric character

Minimum Password Length 7

Password Expiration No Expiration

Password History Reuse No password history tracking

- Require security question on password reset
- Allow browser to save and autofill password field on the login form

2 Authentication / API Login

Help Main	https://developer-cdms.veevavault.com/api/22.2/#authentication
Style	POST
Endpoint	<your Vault URL>/api/v22.2/app/cdm/studies
Parameters	<ul style="list-style-type: none"> ● username ● password <p>(these parameters are part of form-data post style)</p>
Notes	<ul style="list-style-type: none"> ● For login to the vault, get an API session. ● For Basic authorization (e.g. username / password passed) ● Other style login, using non-Basic authentication, see: https://developer.veevavault.com/api/22.2/#oauth-2-0-openid-connect ● Some older vault versions allowed a GET style with username / password. This has been disallowed in later versions (must use a POST). Even with older versions, it's strongly recommended NOT to use a GET style. ● An account to Veeva Vault is on a domain, which is one or more vaults. The above example, the user is on the eke.com domain with the Veeva Vault infrastructure and has access to two vaults on that domain. ● Above, the vaults the user has access to are returned, with parameters for id, name, URL of those vault locations. A vault is one to one with a URL – each of the two vaults above will have their own studies. (multiple studies reside in one vault) ● Note the vaultid return of the JSON at top level, this refers to the active vault on login. (vault ID = 31762). ● Accounts to vault(s) follow: <ul style="list-style-type: none"> ○ Non-production domain: UAT, Training, Dev vaults. □ one account ○ Production domain where production study vaults reside. □ 2nd, different account

Examples

Description / Request	Response
Successful Login	
<p>.../api/v22.2/auth</p> <p>(with post parameters for username / password, in this case user name: eric.emerton@eke.com)</p>	<pre>{ "responseStatus": "SUCCESS", "sessionId": "32735BDA5964E3F43C4F73F6109EFB1E2DCA8A2C1AAEB6B56C44822ADF36EE5C037A5DB751ED8AE924BC4A38EDE92CCB652F136A4AD59C7BB8490F170E514A44", "userId": 92677, "vaultIds": [{ "id": 1004329, "name": "EDC-QA-FAST-EKE", "url": "https://eke-vvqa1-10.vaultdev.com/api" }, { "id": 1004330, "name": "EDC-QA-SLOW-EKE", "url": "https://eke-vvqa1-9.vaultdev.com/api" }], "vaultId": 1004330 }</pre>
Bad User and/or password	
<p>.../api/v22.2/auth</p>	<pre>{ "responseStatus": "FAILURE", "responseMessage": "Authentication failed for user [eric.emerton@eke.com]", "errors": [{ "type": "USERNAME_OR_PASSWORD_INCORRECT", "message": "Authentication failed for user: eric.emerton@eke.com." }], "errorType": "AUTHENTICATION_FAILED" }</pre>
Session timed out	
	<pre>{ "responseStatus": "FAILURE", "errors": [{ "type": "INVALID_SESSION_ID",</pre>

Description / Request	Response
	<pre> "message": "Invalid or expired session ID." }] } } </pre>

- The key portion of a successful authentication return is the **sessionId** parameter:

```

    "responseStatus": "SUCCESS",
    "sessionId":
"32735BDA5964E3F43C4F73F6109EFB1E2DCA8A2C1AAEB6B56C44822ADF36EE5C037A5DB751ED8AE924
BC4A38EDE92CCB652F136A4AD59C7BB8490F170E514A44",
    "userId": 92677,

```

.. as it must be passed in the header of all subsequent requests of the API session.

3 Studies

3.1 Retrieve Studies

Help Main	https://developer-cdms.veevavault.com/api/22.2/#retrieve-studies									
Style	GET									
Endpoint	<your Vault URL>/api/v22.2/app/cdm/studies									
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>limit</td> <td>Optional</td> <td>Pagination API - different limit from the default 1000 can be used</td> </tr> <tr> <td>offset</td> <td>Optional</td> <td>Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd</td> </tr> </tbody> </table>	Name	Req/Opt	Notes	limit	Optional	Pagination API - different limit from the default 1000 can be used	offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd
Name	Req/Opt	Notes								
limit	Optional	Pagination API - different limit from the default 1000 can be used								
offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd								
Notes	<ul style="list-style-type: none"> • Used to retrieve the list of studies in the vault • The casebook versions JSON array within each study entry enumerates all current casebook versions of the study. The casebook versions are assigned at add subject/casebook, per an active version at the subject's site. Later, during amendments, a subject / site / entire study can transition from one version to the next. • ONLY the studies the user has rights to are returned • WARNING: If a user requires training (their role) in the vault, the study will not exist in API returns. Ensure API roles are configured to not be blocked by LMS restrictions • WARNING: The study_name value is what is used for all other requests into / out of CDMS. On rare occasions, the value can be out of sync with the visual study label seen on screen in the UI. For example, in a UAT vault the 6th UAT might be StudyName_UAT6 for study_name, but visually on screen StudyName_CandidateForLive.

4 Countries

4.1 Retrieve Countries

Help Main	WARNING: No CDMS formal endpoint for this yet, instead use of base Vault VQL is shown.
Style	GET
Endpoint	<your Vault URL>/api/v22.2/query?q=SELECT id,abbreviation__v,abbreviation_2__v,name__v from country__v order by name__v
Parameters	<ul style="list-style-type: none"> q (the query, as shown above)
Notes	<ul style="list-style-type: none"> Informational only, do not necessarily actively use. The CDMS concept of ‘Study Country’ is a reference / copy of a base Vault country. This VQL gets that master country list. Study Country is more relevant, being countries ‘in use’ for a study. This query would only be needed if there is a need to detect what other countries are available to the vault, but not activated into a specific study. The 3-character and 2-character ISO codes are returned

Examples

Description / Request (URL)	Response

4.2 Retrieve Study Countries

Help Main	https://developer-cdms.veevavault.com/api/22.2/#retrieve-study-countries												
Style	GET												
Endpoint	<your Vault URL>/api/v22.2/app/cdm/studycountries												
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>study_name</td> <td>Required</td> <td>Name of the study</td> </tr> <tr> <td>limit</td> <td>Optional</td> <td>Pagination API - different limit from the default 1000 can be used</td> </tr> <tr> <td>offset</td> <td>Optional</td> <td>Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd</td> </tr> </tbody> </table>	Name	Req/Opt	Notes	study_name	Required	Name of the study	limit	Optional	Pagination API - different limit from the default 1000 can be used	offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd
Name	Req/Opt	Notes											
study_name	Required	Name of the study											
limit	Optional	Pagination API - different limit from the default 1000 can be used											
offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd											
Notes	<ul style="list-style-type: none"> Used to get the countries of a study. These are activated from the vault's main countries list (previous section) and are then available for selection on a new site. The 3-character country code is returned. The 2 character ISO code will be available in a later release of the API. The workaround is to get 2 character country code from the main Vault countries list - see previous section. It is not necessary to run this in most sessions as the get of sites / subjects will include study countries

Format: yyyy-MM-ddTHH:mm:ssZ	id	Optional	The specific vault ID of the subject, or IDs of several (comma separated) NOTE: One can use the ID filter, but with no other filters (site, study_country, last_modified_date).	limit	Optional	Pagination API - different limit from the default 1000 can be used	offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd
Name	Req/Opt	Notes																										
study_name	Required	Name of the study																										
study_country	Optional	Name of the study country, i.e. just the sites of that country																										
site	Optional	Name/number of the site, i.e. just subjects of that site																										
subject	Optional	Name/Number of the specific subject to filter to.																										
last_modified_date	Optional	Filter to subject's modified since a certain date. Format: yyyy-MM-ddTHH:mm:ssZ																										
id	Optional	The specific vault ID of the subject, or IDs of several (comma separated) NOTE: One can use the ID filter, but with no other filters (site, study_country, last_modified_date).																										
limit	Optional	Pagination API - different limit from the default 1000 can be used																										
offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd																										
Notes	<ul style="list-style-type: none"> Used to get the subjects of a study The response returned includes additional dates for milestones for the subject. These only appear when there is a date value, omitted from response if not set. Milestone dates are set by either study design configuration, or specific set of values by the API (Set Subject Status, later section). The Help Main link above details the names of those potential return values. See the table below for filtering styles. 																											

Subject Filtering Styles / Examples

Style	Example	Result / Notes
Study Context	../subjects?study_name={..}	All subjects
Study Context	../subjects?study_name={..}&study_country=Canada&site=101	Site 101 subjects
Study Context	../subjects?study_name={..}&site=101	Site 101 subjects (with/without country, same)
Study Context	../cdm/subjects?study_name={..}&site=101,102	Site 101 and Site 102 subjects
Study Context	../cdm/subjects?study_name={..}&site=101,102,501	Assuming 501 does not exist, Site 101 / 102, same
Study Context	../cdm/subjects?study_name={..}&site=501,502	ERROR - If neither exists, error return (not empty array), that is, no valid sites
Study Context	../subjects?study_name={..}&study_country=Canada&site=101,102	ERROR - Multi site search is not allowed when including a study country, even if both reside at that country
Study Context	../cdm/subjects?study_name={..}&last_modified_date=2022-07-01T12:00:00Z	Subjects modified since July 1st, 12:00 UTC
By ID	../cdm/subjects?study_name={..}&id=OPP0000001V002	Just the subject with that matching ID, assuming valid Vault ID
By ID	../cdm/subjects?study_name={..}&id=OPP0000001V002,OPP0000001V003	The two subjects, assuming both are valid Vault IDs
By ID	../cdm/subjects?study_name={..}&id=OPP0000001V077,OPP0000001V088	Assuming neither exists, the return is empty JSON array (not an error), e.g. : subjects [] : :

Description / Request (URL)	Response
<p data-bbox="77 254 542 285">Add Many Subjects - Some work, some fail</p> <pre data-bbox="77 306 784 730"> { "study_name": "ABCP-2022-01_DEV1", "subjects": [{ "study_country": "United States", "site": "101" }, { "study_country": "Germany", "site": "201" }] } </pre>	<pre data-bbox="792 306 1568 911"> { "responseStatus": "SUCCESS", "subjects": [{ "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "SCR-0012", }, { "responseStatus": "FAILURE", "errorMessage": "[Study Country] with name [Germany] cannot be found", "study_country": "Germany", "site": "201", }] } </pre>

IMPORTANT: The end result of the add subject/casebook is the same as the UI Create Casebook button/action. The subject is left with only the first event leading, with no date yet. Further actions are performed with additional endpoint calls. (e.g., set event date, then setting of form data, set of subject status)

6.3 Set Subject Status

Help Main	https://developer-cdms.veevavault.com/api/22.2/#set-subject-status																														
Style	POST																														
Endpoint	<your Vault URL>/api/v22.2/app/cdm/subjects/actions/setstatus																														
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Array/Section</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>study_name</td> <td></td> <td>Required</td> <td>Name of the study</td> </tr> <tr> <td>study_country</td> <td>subjects</td> <td>Required</td> <td>Name of the study country (of the subject's site)</td> </tr> <tr> <td>site</td> <td>subjects</td> <td>Required</td> <td>Name/number of the site</td> </tr> <tr> <td>subject</td> <td>subjects</td> <td>Required</td> <td>Subject to set status</td> </tr> <tr> <td>subject_status</td> <td>subjects</td> <td>Required</td> <td>The status to set, using the API name</td> </tr> <tr> <td>date</td> <td>subjects</td> <td>Required</td> <td>Date to set for milestone value of that status. Format: yy-MM-dd</td> </tr> </tbody> </table>			Name	Array/Section	Req/Opt	Notes	study_name		Required	Name of the study	study_country	subjects	Required	Name of the study country (of the subject's site)	site	subjects	Required	Name/number of the site	subject	subjects	Required	Subject to set status	subject_status	subjects	Required	The status to set, using the API name	date	subjects	Required	Date to set for milestone value of that status. Format: yy-MM-dd
Name	Array/Section	Req/Opt	Notes																												
study_name		Required	Name of the study																												
study_country	subjects	Required	Name of the study country (of the subject's site)																												
site	subjects	Required	Name/number of the site																												
subject	subjects	Required	Subject to set status																												
subject_status	subjects	Required	The status to set, using the API name																												
date	subjects	Required	Date to set for milestone value of that status. Format: yy-MM-dd																												
Notes	<ul style="list-style-type: none"> • Used to set the status of a subject • Often done as a 2nd step, right after adding of a new subject (e.g., advance past Pre-Screening default status to Screening, Enrolled, or other) • That subject_status value must be the API name, not the label (e.g. enrolled_v, including the Veeva suffix). See the table below for out of the box statuses, although there can be additional statuses in the vault (custom) • The set of a milestone date, i.e., the date the subject took on that status is required. 'Now' is not specifically used, as this might/could be a date in the past being set. This is the equivalent of a studio design rule, which when some condition is true from submit of form data, a date is set + status changed for the subject. • Refer to the table below / next page for order of precedence of subject statuses, when setting or unset. • A future release of the API will decouple these concepts, so the move of status and/or the set of milestone dates can be done separately, i.e. not using milestone dates, or correcting status dates without having to unset / redo status calls. • WARNING: Currently, the set of multiple subjects, or multiple statuses for one subject (in one API call) is not allowed. The format of request is still with the format of a subjects array, for future state of this endpoint. 																														

Status Order / Precedence

Subject statuses follow an order of precedence, with general rule of thumb that to rollback a status, one must call the **Unset Subject Status** (next section) in reverse order of the precedence:

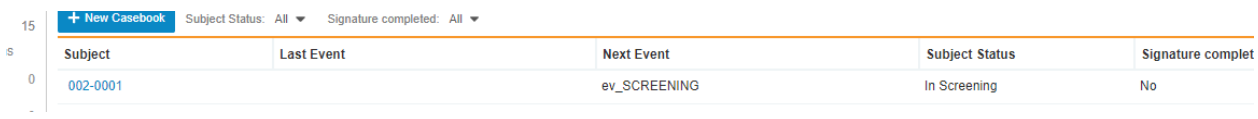

Order	Subject Status	API Value to Set	Field Return in Retrieve Subjects
1	Pre Screen	pre_screen__v	<i>N/A, not a milestone date</i>
2	Consented	consented__v	initial_consent_date
3	In Screening	in_screening__v	screened_date
4	Screen Failure	screen_failure__v	screen_failed_date
5	Enrolled	enrolled__v	enrolled_date
6	Randomized	randomized__v	randomized_date
7	Started Treatment	started_treatment__v	started_treatment_date
8	End Of Treatment	end_of_treatment__v	end_of_treatment_date
9	Withdrawn	withdrawn__v	withdrawn_date
10	Started Follow Up	started_follow_up__v	started_follow_up_date
11	Lost to Follow Up	lost_to_follow_up__v	lost_to_follow_up_date
12	Complete	complete__v	end_of_study_date

7 Event Groups

7.1 Create Event Groups

Help Main	https://developer-cdms.veevavault.com/api/22.2/#create-event-groups																												
Style	POST																												
Endpoint	<your Vault URL>/api/v22.2/app/cdm/eventgroups																												
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Array/Section</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>study_name</td> <td></td> <td>Required</td> <td>Name of the study</td> </tr> <tr> <td>study_country</td> <td>eventgroups</td> <td>Required</td> <td>Name of the study country (of the subject's site)</td> </tr> <tr> <td>site</td> <td>eventgroups</td> <td>Required</td> <td>Name/number of the site</td> </tr> <tr> <td>subject</td> <td>eventgroups</td> <td>Required</td> <td>Subject to act on</td> </tr> <tr> <td>eventgroup_name</td> <td>eventgroups</td> <td>Required</td> <td>Design name in the study of the event group to add/upsert</td> </tr> <tr> <td>date</td> <td>eventgroups</td> <td>Optional*</td> <td>Only applicable to Unscheduled type event groups. Format: yyyy-MM-dd</td> </tr> </tbody> </table>	Name	Array/Section	Req/Opt	Notes	study_name		Required	Name of the study	study_country	eventgroups	Required	Name of the study country (of the subject's site)	site	eventgroups	Required	Name/number of the site	subject	eventgroups	Required	Subject to act on	eventgroup_name	eventgroups	Required	Design name in the study of the event group to add/upsert	date	eventgroups	Optional*	Only applicable to Unscheduled type event groups. Format: yyyy-MM-dd
Name	Array/Section	Req/Opt	Notes																										
study_name		Required	Name of the study																										
study_country	eventgroups	Required	Name of the study country (of the subject's site)																										
site	eventgroups	Required	Name/number of the site																										
subject	eventgroups	Required	Subject to act on																										
eventgroup_name	eventgroups	Required	Design name in the study of the event group to add/upsert																										
date	eventgroups	Optional*	Only applicable to Unscheduled type event groups. Format: yyyy-MM-dd																										
Notes	<ul style="list-style-type: none"> Used to add an Event Group This action will add the 'next' event group, in sequence if the event group repeats. Example: Unscheduled event group currently has 2 existing, the action would add one with event group sequence = 3. Use the upsert (PUT), next section, for conditional add at a specific sequence. Example: 3 unscheduled event groups exist, and attempt to add sequence = 3 is essentially a skip. (i.e. 'add if not there, otherwise do nothing'). For the Unscheduled type event group, the API call must include an event date (format: yyyy-MM-dd). If other event group types, the date is not set in this API call, instead the Set Event Date (see the Set Event Date section) 																												

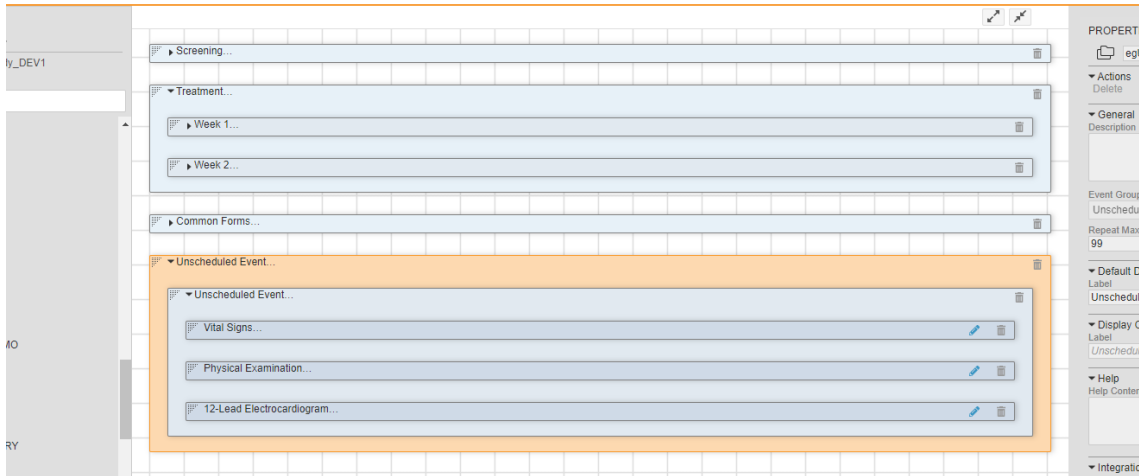

Examples

Description / Request (URL)	Response
Add New Event Groups (multiple subjects in one call)	
<pre>{ "study_name": "ABCP-2022-01_DEV1", "eventgroups": [{ "study_country": "United States", "site": "101", "subject": "101-001", </pre>	<pre>{ "responseStatus": "SUCCESS", "eventgroups": [{ "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", </pre>

Description / Request (URL)	Response
<pre> "eventgroup_name": "egSCREENING" }, { "study_country": "United States", "site": "101", "subject": "101-002", "eventgroup_name": "egIRT_INFO" }] } </pre>	<pre> "subject": "101-001", "eventgroup_name": "egSCREENING", "eventgroup_sequence": 1 }, { "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "101-001", "eventgroup_name": "egIRT_INFO", "eventgroup_sequence": 1 }] } </pre>

Flow Based Example

For the study design: (event groups are eg_SCREENING, eg_TREATMENT, eg_COMMONFORMS, eg_UN, in design name):

The event group (highlighted above) is of Type = **Unscheduled** and has name **egUNS**. The POST (add) example returns the newly added event group sequence since it repeats:

Flow Based Examples

With two unscheduled event groups already existing, a specific target of adding the 3rd unscheduled event:

```

1 {
2   "study_name": "CSM Demo Study_DEV1",
3   "eventgroups": [
4     {
5       "study_country": "United States",
6       "site": "002",
7       "subject": "002-0001",
8       "eventgroup_name": "egUNS",
9       "eventgroup_sequence": 3,
10      "date": "2021-09-10"
11    }
12  ]
13 }

```

```

1 {
2   "responseStatus": "SUCCESS",
3   "eventgroups": [
4     {
5       "responseStatus": "SUCCESS:CREATED",
6       "site": "002",
7       "study_country": "United States",
8       "subject": "002-0001",
9       "eventgroup_name": "egUNS",
10      "eventgroup_sequence": 3
11    }
12  ]
13 }

```

...yields, in EDC:

WARNING: The **Upsert** of an event group is **not** used to update an existing event group, its first event's date. To update the event date, use / see the [Set Event Date](#) API (next section). The use of upsert, when the event group already exists, is merely a 'skip, do nothing' safe call. That is, create/add if not there, otherwise, no changes. This

becomes a safer way to add specific event groups, as [Create Event Group](#) is always a brand new event group, next in sequence.

The event date is required for an event group of type = **Unscheduled**, with failed attempt:

```
Body Cookies Headers (18) Test Results
Pretty Raw Preview Visualize JSON
1 {
2   "responseStatus": "SUCCESS",
3   "eventgroups": [
4     {
5       "responseStatus": "FAILURE",
6       "errorMessage": "Date is required for Unscheduled events",
7       "site": "002",
8       "study_country": "United States",
9       "subject": "002-0001",
10      "eventgroup_name": "egUNS",
11      "eventgroup_sequence": 4
12    }
13  ]
14 }
```

Contrast this to the add of a scheduled event group that only integration (e.g. IRT system) should control / add. For the example study, the **Common Forms** is just such an event group of events/forms. The add is successful:

The screenshot shows a REST client interface with a POST request to `https://edc-services-internal.veevavault.com/api/v21.2/app/cdm/eventgroups`. The request body is a JSON object:

```
1 {
2   ... "study_name": "CSM Demo Study_DEV1",
3   ... "eventgroups": [
4     {
5       ... "study_country": "United States",
6       ... "site": "002",
7       ... "subject": "002-0001",
8       ... "eventgroup_name": "eg_COMMONFORMS"
9     }
10  ]
11 }
```

The response status is 200 OK and the response body is:

```
1 {
2   "responseStatus": "SUCCESS",
3   "eventgroups": [
4     {
5       "responseStatus": "SUCCESS",
6       "site": "002",
7       "study_country": "United States",
8       "subject": "002-0001",
9       "eventgroup_name": "eg_COMMONFORMS",
10      "eventgroup_sequence": 1
11    }
12  ]
13 }
```

With result an EDC event group with no date set, but awaiting entry into the forms of it:

The screenshot shows a web interface with a list of forms under the heading "COMMON FORMS". The forms listed are:

- Vital Signs
- Physical Examination
- Log Forms

Lastly, there are occasions to have an API call add an event group, scheduled (like a Common / Logs area) but that will require a date. In the example study the eg_TREATMENT is the main event group of the study (Events Week 1, Week 2, etc.). The add of it can be done through API:

```

1  {
2  ... "study_name": "CSM-Demo-Study_DEV1",
3  ... "eventgroups": [
4  ... {
5  ...   "study_country": "United-States",
6  ...   "site": "002",
7  ...   "subject": "002-0001",
8  ...   "eventgroup_name": "eg_TREATMENT"
9  ... }
10 ... ]
11 }
    
```

```

1  {
2  ... "responseStatus": "SUCCESS",
3  ... "eventgroups": [
4  ... {
    
```

But, the date is not set – i.e., for the first event of the event group (like unscheduled types are). To set that, one must follow on with a [Set Event Date](#) API call (next section)

8 Events

8.1 Retrieve Events / Forms

Description / Request (URL)	Response
	<pre> "site": "101", "subject": "SCR-0001", "eventgroup_name": "egSCR", "eventgroup_sequence": 1, "event_name": "evSCR", "event_sequence": 1, "locked": false, "frozen": false, "event_date": "2022-06-20", "forms": [{ "form_name": "Informed-Consent", "form_sequence": 1, "form_status": "blank_v", "locked": true, "frozen": true, "intentionally_left_blank": false, "intentionally_left_blank_reason": null }, { "form_name": "Eligibility-Criteria", "form_sequence": 1, "form_status": "submitted_v", "locked": false, "frozen": true, "intentionally_left_blank": false, "intentionally_left_blank_reason": null }, { "form_name": "Demographics", "form_sequence": 1, "form_status": "blank_v", "locked": false, "frozen": true, "intentionally_left_blank": false, "intentionally_left_blank_reason": null }, { "form_name": "Vital-Signs", "form_sequence": 1, "form_status": "blank_v", "locked": false, "frozen": true, "intentionally_left_blank": false, "intentionally_left_blank_reason": null }] </pre>

Description / Request (URL)	Response
	<pre>] } </pre>
<p>Get of an event that is in planned or did not occur status (no forms yet)</p>	
<pre> .../app/cdm/events?study_name=ABCP-2022-01_DEV1&study_country=United States&site=101&subject=SCR-0001&eventgroup_name=egMAIN </pre>	<pre> { "responseStatus": "SUCCESS", "responseDetails": { "limit": 1000, "offset": 0, "size": 1, "total": 1 }, "events": [{ "study_country": "United States", "site": "102", "subject": "SCR-0001", "eventgroup_name": "egMAIN", "eventgroup_sequence": 1, "event_name": "evVISIT1", "event_sequence": 1, "locked": false, "frozen": false, "event_date": null, "forms": [] }] } </pre>

The event date originates from the level above all forms of that event (Jun 20th, 2022 for example):

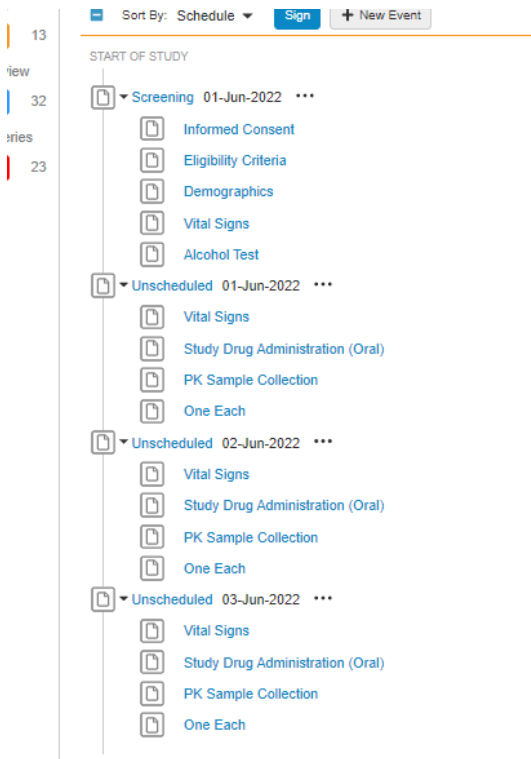

The **Example 2** above includes no forms returned. This can happen when the event status is Planned (no event date yet), or Did Not Occur (specifically marked by site as missed or other reason)

Form Statuses

Label	API Return	When / Notes
Blank	blank__v	The form is not yet visited (no data points / items), or is visited but all fields are their initial blank status. The form can also take on this status after a reset action
In Progress	in_progress__v	At least one data point (item) has its first value in the form
Submitted	submitted__v	The form is in submitted/completed state. No updates (UI or API) can occur until the form is opened for edit NOTE: A form can be in submitted status, and be additionally marked Intentionally Left Blank. (i.e. reasons for not having the data)
In Progress Post Submit	in_progress_post_submit__v	Like submitted, but the form has been submitted (then reopened) at least once.

Consider repeating event groups / events, the eventgroup_sequence is key for identification, as well as the event date.
 Below 3 events – Unscheduled – repeat:

.. with applicable section in the return, noting **eventgroup_sequence: 3** : (June 3rd, 2022)

```

Description / Request (URL)	Response
	<pre>] } </pre>

Setting a specific sequence for repeating event group (events within)

<pre> { "study_name": "ABCP-2022-01_DEV1", "events": [{ "study_country": "United States", "site": "101", "subject": "101-001", "eventgroup_name": "egCYCLE", "eventgroup_sequence": 2, "event_name": "evDYNAMIC_ASSESS", "date": "2022-06-01" }] } </pre>	<pre> { "responseStatus": "SUCCESS", "events": [{ "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "101-001", "eventgroup_name": "egCYCLE", "eventgroup_sequence": 2, "event_name": "evDYNAMIC_ASSESS", "event_sequence": 1, "date": "2022-06-01" }] } </pre>
---	---

Override where the event date would otherwise be out of window

<pre> { "study_name": "ABCP-2022-01_DEV1", "events": [{ "study_country": "United States", "site": "101", "subject": "101-001", "eventgroup_name": "egTREATMENT", "event_name": "evV6" , "date": "2022-06-01", "allow_planneddate_override": true }] } </pre>	<pre> { "responseStatus": "SUCCESS", "events": [{ "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "101-001", "eventgroup_name": "egTREATMENT", "eventgroup_sequence": 1, "event_name": "evV6", "event_sequence": 1 }] } </pre>
--	---

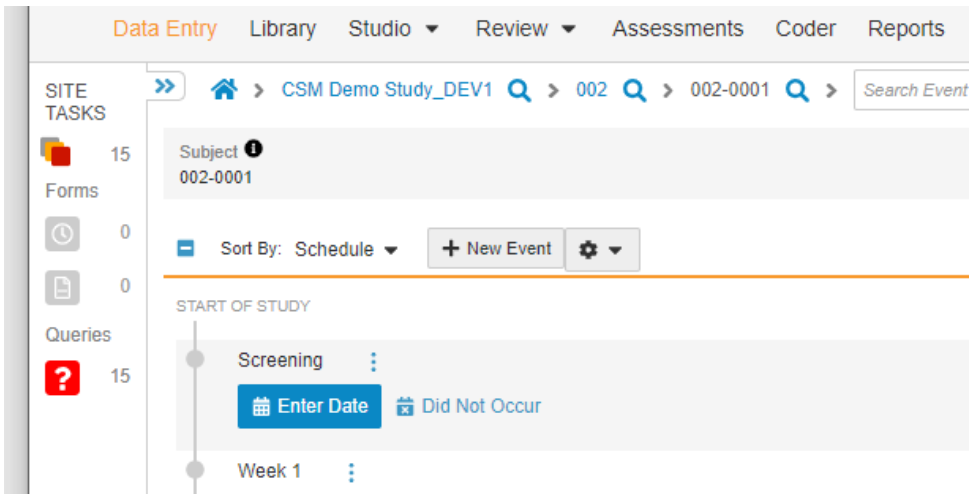

Change of date (requires reason)

<pre> { "study_name": "ABCP-2022-01_DEV1", "events": [{ "study_country": "United States", "site": "101", "subject": "101-001", "eventgroup_name": "egTREATMENT", </pre>	<pre> { "responseStatus": "SUCCESS", "events": [{ "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "101-001", </pre>
--	---

Description / Request (URL)	Response
<pre> "event_name": "evV6" , "date": "2022-06-02", "change_reason": "Change by IRT system" }] } </pre>	<pre> "eventgroup_name": "egTREATMENT", "eventgroup_sequence": 1, "event_name": "evV6", "event_sequence": 1 }] } </pre>

Flow Based Example

For this subject in the EDC UI, there is no **Screening** date yet:

The screenshot shows the EDC UI interface for a subject. The breadcrumb navigation indicates the path: CSM Demo Study_DEV1 > 002 > 002-0001. The subject ID is 002-0001. The event 'Screening' is currently set to 'Did Not Occur' and has an 'Enter Date' button next to it. The timeline shows 'START OF STUDY' and 'Week 1'.

Performing the API call to set **Sept 1, 2021**, as **Screening** event date:

```

1  {
2  ... "study_name": "CSM-Demo-Study_DEV1",
3  ... "events": [
4  ... {
5  ...   "study_country": "United States",
6  ...   "site": "002",
7  ...   "subject": "002-0001",
8  ...   "eventgroup_name": "eg_SCREENING",
9  ...   "event_name": "ev_SCREENING",
10 ...   "date": "2021-09-01"

```

11 "event_name": "ev_SCREENING",

```

...which yields – in the EDC UI – the event now built out with the forms the study scheduled prescribes:

IMPORTANT: This step is key to then being able to set data to forms of an event. If the event does not have a date yet, then no forms will exist (for scheduled, non-log events).

For changing the date of an existing event, the same call can be used:

```

POST https://edc-services-internal.veevavault.com/api/v21.2/app/cdm/events/actions/setdate

Params Authorization Headers (12) Body Pre-request Script Tests Settings
● none ● form-data ● x-www-form-urlencoded ● raw ● binary ● GraphQL JSON

1 {

9.2 Create Forms

Help Main	https://developer-cdms.veevavault.com/api/22.2/#create-forms																																				
Style	POST																																				
Endpoint	<your Vault URL>/api/v22.2/app/cdm/forms																																				
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Array</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>study_name</td> <td></td> <td>Required</td> <td>Name of the study</td> </tr> <tr> <td>study_country</td> <td>forms</td> <td>Required</td> <td>Name of the study country (of the subject's site)</td> </tr> <tr> <td>site</td> <td>forms</td> <td>Required</td> <td>Name/number of the site</td> </tr> <tr> <td>subject</td> <td>forms</td> <td>Required</td> <td>Subject to act on</td> </tr> <tr> <td>eventgroup_name</td> <td>forms</td> <td>Required</td> <td>Design name in the study of the event group</td> </tr> <tr> <td>eventgroup_sequence</td> <td>forms</td> <td>Optional</td> <td>The specific sequence of an event group. 1 assumed if omitted</td> </tr> <tr> <td>event_name</td> <td>forms</td> <td>Required</td> <td>Design name in the study of the event</td> </tr> <tr> <td>form_name</td> <td>forms</td> <td>Required</td> <td>Design name in the study of the form to add</td> </tr> </tbody> </table>	Name	Array	Req/Opt	Notes	study_name		Required	Name of the study	study_country	forms	Required	Name of the study country (of the subject's site)	site	forms	Required	Name/number of the site	subject	forms	Required	Subject to act on	eventgroup_name	forms	Required	Design name in the study of the event group	eventgroup_sequence	forms	Optional	The specific sequence of an event group. 1 assumed if omitted	event_name	forms	Required	Design name in the study of the event	form_name	forms	Required	Design name in the study of the form to add
Name	Array	Req/Opt	Notes																																		
study_name		Required	Name of the study																																		
study_country	forms	Required	Name of the study country (of the subject's site)																																		
site	forms	Required	Name/number of the site																																		
subject	forms	Required	Subject to act on																																		
eventgroup_name	forms	Required	Design name in the study of the event group																																		
eventgroup_sequence	forms	Optional	The specific sequence of an event group. 1 assumed if omitted																																		
event_name	forms	Required	Design name in the study of the event																																		
form_name	forms	Required	Design name in the study of the form to add																																		
Notes	<ul style="list-style-type: none"> • The action is for repeating form area of the study schedule, to add new ones as necessary • It can also be used for a specific dynamic form area of the study design, to an event that already exists. (event non repeating) • When the form does not yet exist, this action MUST be performed first, prior to setting data on the form. (Combination API(s) are part of coming release) • Like many other API calls, batch add of many is allowed in one call. (Just more entries in the JSON array for forms) • Like event groups, the POST / create will blindly add the 'next', in sequence. It's good practice to inspect what forms exist already as part of a sequence of API calls. Or one can use the PUT / upsert instead, passing a specific form_sequence – which will create if not present or skip/do nothing when the sequence does exist. (see next section Upsert Forms) • TIP: For a non-repeating event group, and eventgroup_sequence not strictly required, it is good practice to always include this value. Repeating event groups, later forms will need specific values. 																																				

Examples

Description / Request (URL)	Response
Add of one form	
<pre> { "study_name": "ABCP-2022-01_DEV1", "forms": [{ "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "LOGS", "event_name": "LOGS", "form_name": "AE" }] } </pre>	<pre> { "responseStatus": "SUCCESS", "forms": [{ "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "LOGS", "eventgroup_sequence": 1, "event_name": "LOGS", "event_sequence": 1, "form_name": "AE", "form_sequence": 1 }] } </pre>
Add of two more forms, N+1 and N+2 are added (when current N exist)	
<pre> { "study_name": "ABCP-2022-01_DEV1", "forms": [{ "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "LOGS", "event_name": "LOGS", "form_name": "AE" }, { "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "LOGS", "event_name": "LOGS", "form_name": "AE" }] } </pre>	<pre> { "responseStatus": "SUCCESS", "forms": [{ "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "LOGS", "eventgroup_sequence": 1, "event_name": "LOGS", "event_sequence": 1, "form_name": "AE", "form_sequence": 2 }, { "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "LOGS", "eventgroup_sequence": 1, "event_name": "LOGS", "event_sequence": 1, "form_name": "AE", }] } </pre>

Description / Request (URL)	Response
	<pre> "form_sequence": 3 }] } </pre>
<p>Attempt to add two, but the last violates the maximum repeats of that design location in the study</p>	
<pre> { "study_name": "ABCP-2022-01_DEV1", "forms": [{ "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "LOGS", "event_name": "LOGS", "form_name": "AE" }, { "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "LOGS", "event_name": "LOGS", "form_name": "AE" }] } </pre>	<pre> { "responseStatus": "SUCCESS", "forms": [{ "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "LOGS", "eventgroup_sequence": 1, "event_name": "LOGS", "event_sequence": 1, "form_name": "AE", "form_sequence": 4 }, { "responseStatus": "FAILURE", "errorMessage": "Maximum number of repeating records reached", "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "LOGS", "eventgroup_sequence": 1, "event_name": "LOGS", "event_sequence": 1, "form_name": "AE" }] } </pre>

Flow Based Examples

Consider this EDC form area, **General Medical History**, a repeating section:

The location, design name wise (use SDS or other to get mappings) is Event Group = **eg_SCREENING**, Event = **ev_SCREENING**, Form = **MH**. The attempt to add a new form:

```

POST https://edc-services-internal.veevavault.com/api/v21.2/app/cdm/forms

{
  "study_name": "CSM-Demo-Study_DEV1",
  "forms": [
    {
      "study_country": "United States",
      "site": "002",
      "subject": "002-0001",
      "eventgroup_name": "eg_SCREENING",
      "event_name": "ev_SCREENING",
      "form_name": "MH"
    }
  ]
}

{
  "responseStatus": "SUCCESS",
  "forms": [
    {
      "responseStatus": "SUCCESS",
      "study_country": "United States",
      "site": "002",
      "subject": "002-0001",
      "eventgroup_name": "eg_SCREENING",
      "eventgroup_sequence": 1,
      "event_name": "ev_SCREENING",
      "event_sequence": 1,
      "form_name": "MH",
      "form_sequence": 1
    }
  ]
}
    
```

...which yields the new form in the EDC UI (blank):

The visual '**Reference #**' in the EDC UI is the API **form_sequence**.

Calling the API again (blindly):

```

Body Cookies Headers (16) Test Results
Pretty Raw Preview Visualize JSON
1
2   "responseStatus": "SUCCESS",
3   "forms": [
4     {
5       "responseStatus": "SUCCESS",
6       "study_country": "United States",
7       "site": "002",
8       "subject": "002-0001",
9       "eventgroup_name": "eg_SCREENING",
10      "eventgroup_sequence": 1,
11      "event_name": "ev_SCREENING",
12      "event_sequence": 1,
13      "form_name": "MH",
14      "form_sequence": 2

```

.. note the **form_sequence: 2** – i.e., a 2nd form is/was added. This can be dangerous in sequences where data is being updated, so inspecting existing forms is always recommended.

9.3 Upsert Forms

Name	Array	Req/Opt	Notes																																						
study_name		Required	Name of the study																																						
study_country	forms	Required	Name of the study country (of the subject's site)																																						
site	forms	Required	Name/number of the site																																						
subject	forms	Required	Subject to act on																																						
eventgroup_name	forms	Required	Design name in the study of the event group																																						
eventgroup_sequence	forms	Optional	The specific sequence of an event group. 1 assumed if omitted																																						
event_name	forms	Required	Design name in the study of the event																																						
form_name	forms	Required	Design name in the study of the form to add																																						
form_sequence	forms	Required	The specific sequence to add (or skip, if already exists)																																						
Notes	<ul style="list-style-type: none"> • The action is for repeating form area of the study schedule, to add new ones as necessary • It can also be used for a specific dynamic form area of the study design, to an event that already exists. (event non repeating) • When the form does not yet exist, this action MUST be performed first, prior to setting data on the form. (Combination API(s) are part of coming release) • Like many other API calls, batch add of many is allowed in one call. (Just more entries in the JSON array for forms) • The Add Forms (previous section) is the equivalent of clicking Add in the EDC UI, receiving the 'next' in sequence. This endpoint differs in that one is asking for a very specific sequence to be added (or skipped in add, if existing). • TIP: For a non-repeating event group, and eventgroup_sequence not strictly required, it is good practice to always include this value. Repeating event groups, later forms will need specific values. • WARNING: The sequences of forms should be added in order. Leaving a 'hole' (e.g. Form Sequence = 2, where Form Sequence = 1 entry does not exist) should be avoided, and will be enforced as an error at this or later release. 																																								

Examples

Description / Request (URL)	Response
Add of one (doesn't currently exist)	
<pre>{ "study_name": "ABCP-2022-01_DEV1", "forms": [{ "study_country": "United States", "site": "101", "subject": "SCR-0003", "eventgroup_name": "LOGS", "event_name": "LOGS", "form_name": "AE", "form_sequence": 1 }] }</pre>	<pre>{ "responseStatus": "SUCCESS", "forms": [{ "responseStatus": "SUCCESS:CREATED", "study_country": "United States", "site": "101", "subject": "SCR-0003", "eventgroup_name": "LOGS", "eventgroup_sequence": 1, "event_name": "LOGS", "event_sequence": 1, "form_name": "AE", "form_sequence": 1 }] }</pre>
Attempt Upsert at location where form exists already (Essentially SKIPPED)	
<pre>{ "study_name": "ABCP-2022-01_DEV1", "forms": [{ "study_country": "United States", "site": "101", "subject": "SCR-0003", "eventgroup_name": "LOGS", "event_name": "LOGS", "form_name": "AE", "form_sequence": 1 }] }</pre>	<pre>{ "responseStatus": "SUCCESS", "forms": [{ "responseStatus": "SUCCESS:UPDATED", "study_country": "United States", "site": "101", "subject": "SCR-0003", "eventgroup_name": "LOGS", "eventgroup_sequence": 1, "event_name": "LOGS", "event_sequence": 1, "form_name": "AE", "form_sequence": 1 }] }</pre>
Add of many, with the last hitting the maximum repeats of study design at that location	
<pre>{ "study_name": "ABCP-2022-01_DEV1", "forms": [{ "study_country": "United States",</pre>	<pre>{ "responseStatus": "SUCCESS", "forms": [{</pre>

Description / Request (URL)	Response
<pre> "site": "101", "subject": "SCR-0003", "eventgroup_name": "LOGS", "event_name": "LOGS", "form_name": "AE". "form_sequence": 4 }, { "study_country": "United States", "site": "101", "subject": "SCR-0003", "eventgroup_name": "LOGS", "event_name": "LOGS", "form_name": "AE". Name	Array	Req/Opt	Notes																																										
study_name		Required	Name of the study																																										
study_country	itemgroups	Required	Name of the study country (of the subject's site)																																										
site	itemgroups	Required	Name/number of the site																																										
subject	itemgroups	Required	Subject to act on																																										
eventgroup_name	itemgroups	Required	Design name in the study of the event group																																										
eventgroup_sequence	itemgroups	Optional	The specific sequence of an event group. 1 assumed if omitted																																										
event_name	itemgroups	Required	Design name in the study of the event																																										
form_name	itemgroups	Required	Design name in the study of the form																																										
form_sequence	itemgroups	Optional	The specific sequence of the form where add will occur. 1 assumed if omitted																																										
itemgroup_name	itemgroups	Required	Design name in the study of the item group to add																																										
Notes	<ul style="list-style-type: none"> • The action is for repeating item groups, within a form that are repeating in nature (only). • The endpoint is the equivalent of the EDC UI Add Section button, i.e. adds the 'next' in sequence • The Maximum Repeats value of the study design will be enforced when attempting to add more than allowed by study design. • When later setting data, the Upsert Form Data (later section) will automatically add any item groups that do not exist (and are repeating). • Like many other API calls, batch add of many is allowed in one call. (Just more entries in the JSON array for itemgroups) • Like event groups, forms that repeat, the POST / create will blindly add the 'next', in sequence. It's good practice to inspect what forms exist already as part of a sequence of API calls. Or one can use the PUT / Upsert instead (next section), passing a specific itemgroup_sequence – which will create if not present or skip/do nothing when the sequence does exist. 																																												

Examples

Description / Request (URL)	Response
Add of one (next)	
<pre>{ "study_name": "ABCP-2022-01_DEV1", "itemgroups": [{ "study_country": "United States", </pre>	<pre>{ "responseStatus": "SUCCESS", "itemgroups": [{ "responseStatus": "SUCCESS", </pre>

Description / Request (URL)	Response
<pre> "site": "101", "subject": "SCR-0002", "eventgroup_name": "egSCR", "event_name": "evSCR", "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2" }] } </pre>	<pre> "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "egSCR", "eventgroup_sequence": 1, "event_name": "evSCR", "event_sequence": 1, "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2", "itemgroup_sequence": 1 }] } </pre>

Add of three, but maximum repeats is 2 at that location

<pre> { "study_name": "ABCP-2022-01_DEV1", "itemgroups": [{ "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "egSCR", "event_name": "evSCR", "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2" }, { "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "egSCR", "event_name": "evSCR", "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2" }, { "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "egSCR", "event_name": "evSCR", "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2" }] } </pre>	<pre> { "responseStatus": "SUCCESS", "itemgroups": [{ "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "egSCR", "eventgroup_sequence": 1, "event_name": "evSCR", "event_sequence": 1, "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2", "itemgroup_sequence": 1 }, { "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "egSCR", "eventgroup_sequence": 1, "event_name": "evSCR", "event_sequence": 1, "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2", "itemgroup_sequence": 2 }] } </pre>
--	--

Description / Request (URL)	Response
<pre> }] } </pre>	<pre> "responseStatus": "FAILURE", "errorMessage": "Maximum number of repeating records reached", "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "egSCR", "eventgroup_sequence": 1, "event_name": "evSCR", "event_sequence": 1, "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2" }] } </pre>

Flow Based Example

The location, design name wise (use SDS or other to get mappings) is Event Group = **eg_SCREENING**, Event = **ev_SCREENING**, Form = **IE**, Item Group = **IECAT**. The first item group add:

The screenshot shows a REST client interface with a POST request to `https://edc-services-internal.veevavault.com/api/v21.2/app/cdm/itemgroups`. The request body is a JSON object with the following fields:

```

1 {
2   "study_name": "CSM Demo Study_DEV1",
3   "itemgroups": [
4     {
5       "study_country": "United States",
6       "site": "002",
7       "subject": "002-0001",
8       "eventgroup_name": "eg_SCREENING",
9       "eventgroup_sequence": 1,
10      "event_name": "ev_SCREENING",
11      "form_name": "IE",
12      "form_sequence": 1,
13      "itemgroup_name": "IECAT"
14    }
15  ]

```

The response body is a JSON object with the following fields:

```

1 {
2   "responseStatus": "SUCCESS",
3   "itemgroups": [
4     {
5       "responseStatus": "SUCCESS",
6       "study_country": "United States",
7       "site": "002",
8       "subject": "002-0001",
9       "eventgroup_name": "eg_SCREENING",
10      "eventgroup_sequence": 1,
11      "event_name": "ev_SCREENING",
12      "event_sequence": 1,
13      "form_name": "IE",
14      "form_sequence": 1,
15      "itemgroup_name": "IECAT",
16      "itemgroup_sequence": 1
17    }
18  ]

```

The status bar indicates a 200 OK response.

... resulting in the EDC UI view:

The screenshot shows the EDC UI interface for a screening event. The left sidebar shows a tree view of events, with "Screening 31-Aug-2021" selected. The main content area displays the "Screening (31-Aug-2021): Inclusion/Exclusion Criteria" section. The "Eligibility Criteria" section contains the following questions:

- Did the subject meet all inclusion and exclusion criteria? No Yes
- What ARM was the subject assigned? Arm 1 Arm 2

The "Inclusion Criteria Not Met and Exclusion Criteria Met (1 of 1)" section shows a dropdown menu for "Inclusion/Exclusion criteria not met".

Calling the **POST** again, a 2nd will be blindly added. Always consider inspecting what is currently on the form during an update sequence.

```

1  {
2  ..... "study_name": "CSM Demo Study_DEV1",
3  ..... "itemgroups": [
4  ..... {
5  .....   "study_country": "United States",
6  .....   "site": "002",
7  .....   "subject": "002-0001",
8  .....   "eventgroup_name": "eg_SCREENING",
9  .....   "eventgroup_sequence": 1,
10 .....   "event_name": "ev_SCREENING",
11 .....   "form_name": "IE",
12 .....   "form_sequence": 1,
13 .....   "itemgroup_name": "IECAT"
14 ..... }
15 ..... ]

```

Body Cookies Headers (16) Test Results

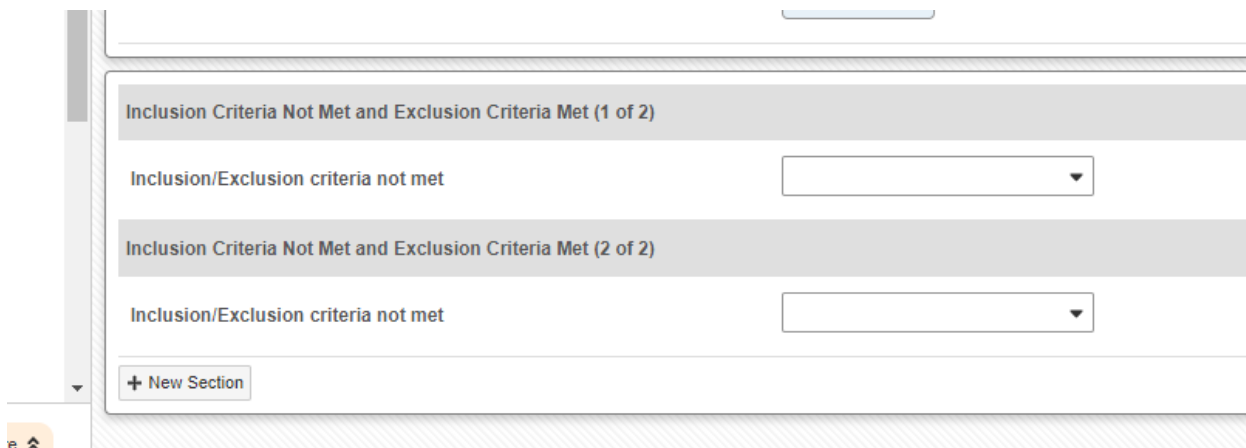

Pretty Raw Preview Visualize JSON

```

1  {
2  "responseStatus": "SUCCESS",
3  "itemgroups": [
4  {
5  "responseStatus": "SUCCESS",
6  "study_country": "United States",
7  "site": "002",
8  "subject": "002-0001",
9  "eventgroup_name": "eg_SCREENING",
10 "eventgroup_sequence": 1,
11 "event_name": "ev_SCREENING",

13 "form_name": "IE",
14 "form_sequence": 1,
15 "itemgroup_name": "IECAT",
16 "itemgroup_sequence": 2

```

... with result a 2nd item group / area on the form:

Inclusion Criteria Not Met and Exclusion Criteria Met (1 of 2)

Inclusion/Exclusion criteria not met

Inclusion Criteria Not Met and Exclusion Criteria Met (2 of 2)

Inclusion/Exclusion criteria not met

+ New Section

9.5 Upsert Item Groups

Help Main	https://developer-cdms.veevavault.com/api/22.2/#upsert-item-groups																																																
Style	PUT																																																
Endpoint	<your Vault URL>/api/v22.2/app/cdm/itemgroups																																																
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Array</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>study_name</td> <td></td> <td>Required</td> <td>Name of the study</td> </tr> <tr> <td>study_country</td> <td>itemgroups</td> <td>Required</td> <td>Name of the study country (of the subject's site)</td> </tr> <tr> <td>site</td> <td>itemgroups</td> <td>Required</td> <td>Name/number of the site</td> </tr> <tr> <td>subject</td> <td>itemgroups</td> <td>Required</td> <td>Subject to act on</td> </tr> <tr> <td>eventgroup_name</td> <td>itemgroups</td> <td>Required</td> <td>Design name in the study of the event group</td> </tr> <tr> <td>eventgroup_sequence</td> <td>itemgroups</td> <td>Optional</td> <td>The specific sequence of an event group. 1 assumed if omitted</td> </tr> <tr> <td>event_name</td> <td>itemgroups</td> <td>Required</td> <td>Design name in the study of the event</td> </tr> <tr> <td>form_name</td> <td>itemgroups</td> <td>Required</td> <td>Design name in the study of the form</td> </tr> <tr> <td>form_sequence</td> <td>itemgroups</td> <td>Optional</td> <td>The specific sequence of the form where add will occur. 1 assumed if omitted</td> </tr> <tr> <td>itemgroup_name</td> <td>itemgroups</td> <td>Required</td> <td>Design name in the study of the item group to add</td> </tr> <tr> <td>itemgroup_sequence</td> <td>itemgroups</td> <td>Required</td> <td>The specific sequence to add, or skip if it does not exist yet</td> </tr> </tbody> </table>	Name	Array	Req/Opt	Notes	study_name		Required	Name of the study	study_country	itemgroups	Required	Name of the study country (of the subject's site)	site	itemgroups	Required	Name/number of the site	subject	itemgroups	Required	Subject to act on	eventgroup_name	itemgroups	Required	Design name in the study of the event group	eventgroup_sequence	itemgroups	Optional	The specific sequence of an event group. 1 assumed if omitted	event_name	itemgroups	Required	Design name in the study of the event	form_name	itemgroups	Required	Design name in the study of the form	form_sequence	itemgroups	Optional	The specific sequence of the form where add will occur. 1 assumed if omitted	itemgroup_name	itemgroups	Required	Design name in the study of the item group to add	itemgroup_sequence	itemgroups	Required	The specific sequence to add, or skip if it does not exist yet
Name	Array	Req/Opt	Notes																																														
study_name		Required	Name of the study																																														
study_country	itemgroups	Required	Name of the study country (of the subject's site)																																														
site	itemgroups	Required	Name/number of the site																																														
subject	itemgroups	Required	Subject to act on																																														
eventgroup_name	itemgroups	Required	Design name in the study of the event group																																														
eventgroup_sequence	itemgroups	Optional	The specific sequence of an event group. 1 assumed if omitted																																														
event_name	itemgroups	Required	Design name in the study of the event																																														
form_name	itemgroups	Required	Design name in the study of the form																																														
form_sequence	itemgroups	Optional	The specific sequence of the form where add will occur. 1 assumed if omitted																																														
itemgroup_name	itemgroups	Required	Design name in the study of the item group to add																																														
itemgroup_sequence	itemgroups	Required	The specific sequence to add, or skip if it does not exist yet																																														
Notes	<ul style="list-style-type: none"> • The action is for repeating item groups, within a form that are repeating in nature (only). • The endpoint is the equivalent of the EDC UI Add Section button, but for a specific sequence. The action will add the item group if it does not exist, or skip the action if it already exists. • The Maximum Repeats value of the study design will be enforced when attempting to add more than allowed by study design. • Unlike the upsert for event groups and forms, the attempt to upsert at a sequence where it would otherwise leave 'gaps' in the sequences, the attempt for itemgroups will instead add all necessary. Example: No item groups exist currently, and attempt uses itemgroup_sequence=3, the result will be the addition of 3 item groups, sequence 1, 2, and 3. • TIP: When later setting data, the Upsert Form Data (later section) will automatically add any item groups that do not exist (and are repeating). This alleviates the need to inspect and add item groups before setting specific data (i.e. need to do both) • Like many other API calls, batch add of many is allowed in one call. (Just more entries in the JSON array for itemgroups) 																																																

Examples

Description / Request (URL)	Response
Two adds, successful	
<pre> { "study_name": "ABCP-2022-01_DEV1", "itemgroups": [{ "study_country": "United States", "site": "101", "subject": "SCR-0006", "eventgroup_name": "egSCR", "event_name": "evSCR", "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2", "itemgroup_sequence": 1 }, { "study_country": "United States", "site": "101", "subject": "SCR-0006", "eventgroup_name": "egSCR", "event_name": "evSCR", "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2", "itemgroup_sequence": 2 }] } </pre>	<pre> { "responseStatus": "SUCCESS", "itemgroups": [{ "responseStatus": "SUCCESS:CREATED", "study_country": "United States", "site": "101", "subject": "SCR-0006", "eventgroup_name": "egSCR", "eventgroup_sequence": 1, "event_name": "evSCR", "event_sequence": 1, "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2", "itemgroup_sequence": 1 }, { "responseStatus": "SUCCESS:CREATED", "study_country": "United States", "site": "101", "subject": "SCR-0006", "eventgroup_name": "egSCR", "eventgroup_sequence": 1, "event_name": "evSCR", "event_sequence": 1, "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2", "itemgroup_sequence": 2 }] } </pre>
Add attempt, but the item group already exists (essentially SKIPPED)	
<pre> { "study_name": "ABCP-2022-01_DEV1", "itemgroups": [{ "study_country": "United States", "site": "101", "subject": "SCR-0006", "eventgroup_name": "egSCR", "event_name": "evSCR", </pre>	<pre> { "responseStatus": "SUCCESS", "itemgroups": [{ "responseStatus": "SUCCESS:UPDATED", "study_country": "United States", "site": "101", "subject": "SCR-0006", "eventgroup_name": "egSCR", </pre>

Description / Request (URL)	Response
<pre> "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2", "itemgroup_sequence": 1 }] } </pre>	<pre> "eventgroup_sequence": 1, "event_name": "evSCR", "event_sequence": 1, "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2", "itemgroup_sequence": 1 }] } </pre>

Add of a later sequence - the result is add of all 'up to', i.e. gaps filled

<pre> { "study_name": "ABCP-2022-01_DEV1", "itemgroups": [{ "study_country": "United States", "site": "101", "subject": "SCR-0007", "eventgroup_name": "egSCR", "event_name": "evSCR", "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2", "itemgroup_sequence": 2 }] } </pre>	<pre> { "responseStatus": "SUCCESS", "itemgroups": [{ "responseStatus": "SUCCESS:CREATED", "study_country": "United States", "site": "101", "subject": "SCR-0006", "eventgroup_name": "egSCR", "eventgroup_sequence": 1, "event_name": "evSCR", "event_sequence": 1, "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2", "itemgroup_sequence": 1 }, { "responseStatus": "SUCCESS:CREATED", "study_country": "United States", "site": "101", "subject": "SCR-0006", "eventgroup_name": "egSCR", "eventgroup_sequence": 1, "event_name": "evSCR", "event_sequence": 1, "form_name": "IE", "form_sequence": 1, "itemgroup_name": "ig-IE2", "itemgroup_sequence": 2 }] } </pre>
---	--

Add of a later sequence - the result is add of all 'up to', i.e. gaps filled

Notes	<ul style="list-style-type: none"> The action is for setting data on fields of a form The differences between POST and PUT style: <ul style="list-style-type: none"> POST style requires that all item groups (i.e. if repeating) must exist first. PUT style does not require the specific upsert of any necessary item groups on the form. They are automatically added where needed The 'inner' status on the PUT style includes the secondary status of 'CREATED' (item group of the item was created) or 'UPDATED' (item already existed) TIP: Consider always using the PUT / upsert. Note the array at top level is the forms (json array) to direct data to, multiple forms can be targeted in one API call. The 2nd level items, which are the items on that form, each of which requires itemgroup_name, item_name, value, and other parameters, based on the field type. See the table below for guidelines based on EDC field type WARNING: If a form is submitted state, it must first be opened for edit via a different API endpoint, Edit Form (later section), before proceeding with the update of data. Currently there is no parameter to allow for conditional open for edit, during the call to update data on a form, not a parameter to additionally submit the form once data is updated/added. TIP: Although the example above is from a Screening event, in a non-repeating event group, and eventgroup_sequence is not strictly required it is good practice to always include this value. The same is true for the sequence of form, and of course itemgroup (of the items being updated) 																																																				

- **WARNING:** As of the 22R2 release - item groups on forms that are used in the Local Labs module are disallowed from updates through the API.

Setting Data by Item Type

Item Type	Example	Notes
Checkbox		
	"value": "true"	i.e. checked
	"value": "false"	i.e. unchecked
	"value": ""	Has the same effect as false - Suggestion is to use true / false always in payload.
	(any other value)	Error returned
Codelist		
	"value": "Y"	i.e. assuming that codelist has a code value of "Y" in its
	"value": ""	Empty / unset the selection
	(any other value, i.e. not a codelist code)	Error returned
URL		
	"value": "https://www.google.com"	Set the value to a URL, on screen user can click to navigate to the URL, in another tab
	"value": ""	Empty / unset the value
	(any value that does not start http or ftp)	Error returned
Text Field		
	"value": "Here is my text in the field"	Set a value
	"value": ""	Empty / unset the value
	(value over max length)	Error returned
Numeric (Integer or Decimal)		
	"value": "3"	E.g. a field with precision = 0 (no decimal portion)
	"value": "13.4"	E.g. a decimal portion allowed field (precision > 0)
	"value": ""	Empty / unset the value
	(not numeric or violates length or precision)	Error returned
Date Field		
	"value": "2022-06-01"	E.g. to set June 1st, 2022
	"value": ""	Empty / unset the value
	"value": "2022-UN-UN"	E.g. when the field allows unknowns in month and/or day. UN must be used in the appropriate portion
	(bad date, not of proper format, YYYY-MM-DD)	Error returned
Date Time Field		
	"value": "2022-06-01T12:30:00Z"	Set the datetime in full, this will take on the 'on screen' value (not the normalized)
	"value": ""	Empty / unset the value

Item Type	Example	Notes
	(bad date, not of proper format, yyyy-MM-ddTHH:mmZ)	Error returned
Time Field		
	"value": "12:30"	Set the time value
	"value": ""	Empty / unset the value
	(bad date, not of proper format, HH:mm)	Error returned
Unit Codelist		
	"value": "62.2" "unit_value": "in"	E.g. 'in' is a valid code in the unit codelist definition.
	"value": "" "unit_value": ""	Empty / unset the value
	"value": "62.2"	Error returned (must have both)
	(any violation of length, precision, or invalid unit code)	Error returned

Examples

Description / Request (URL)	Response
Set of data on a form with one of each field/item type	
<pre>{ "study_name": "ABCP-2022-01_DEV1", "forms": [{ "site": "101", "study_country": "United States", "subject": "SCR-0001", "eventgroup_name": "egUNS", "eventgroup_sequence": 3, "event_name": "evUNS", "form_name": "OE", "form_sequence": 1, "items": [{ "itemgroup_name": "igOE", "itemgroup_sequence": 1, "item_name": "CB", "value": "true" }, { "itemgroup_name": "igOE", "itemgroup_sequence": 1, "item_name": "CL", </pre>	<pre>{ "responseStatus": "SUCCESS", "items": [{ "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "SCR-0001", "eventgroup_name": "egUNS", "eventgroup_sequence": 3, "event_name": "evUNS", "event_sequence": 1, "form_name": "OE", "form_sequence": 1, "itemgroup_name": "igOE", "itemgroup_sequence": 1, "item_name": "CB", "value": "true" }, { "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", </pre>

Description / Request (URL)	Response
	<pre> "subject": "SCR-0001", "eventgroup_name": "egUNS", "eventgroup_sequence": 3, "event_name": "evUNS", "event_sequence": 1, "form_name": "OE", "form_sequence": 1, "itemgroup_name": "igOE", "itemgroup_sequence": 1, "item_name": "DECIMAL", "value": "5.2" }, { "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "SCR-0001", "eventgroup_name": "egUNS", "eventgroup_sequence": 3, "event_name": "evUNS", "event_sequence": 1, "form_name": "OE", "form_sequence": 1, "itemgroup_name": "igOE", "itemgroup_sequence": 1, "item_name": "UCLFIELD", "value": "2.1", "unit_value": "double_std" }, { "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "SCR-0001", "eventgroup_name": "egUNS", "eventgroup_sequence": 3, "event_name": "evUNS", "event_sequence": 1, "form_name": "OE", "form_sequence": 1, "itemgroup_name": "igOE", "itemgroup_sequence": 1, "item_name": "URL_FIELD", "value": "https://www.google.com" }, { "responseStatus": "SUCCESS", "study_country": "United States", </pre>

Description / Request (URL)	Response
	<pre> "site": "101", "subject": "SCR-0001", "eventgroup_name": "egUNS", "eventgroup_sequence": 3, "event_name": "evUNS", "event_sequence": 1, "form_name": "OE", "form_sequence": 1, "itemgroup_name": "igOE", "itemgroup_sequence": 1, "item_name": "SHORTTXT", "value": "Some text short" }, { "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "SCR-0001", "eventgroup_name": "egUNS", "eventgroup_sequence": 3, "event_name": "evUNS", "event_sequence": 1, "form_name": "OE", "form_sequence": 1, "itemgroup_name": "igOE", "itemgroup_sequence": 1, "item_name": "LONGTXT", "value": "Some text in a long text field \n with a line break in the payload" }] } </pre>

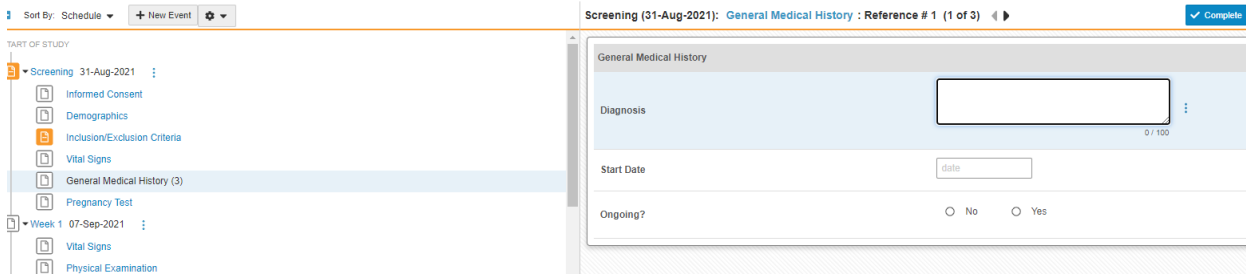

Change of an item (i.e. reopened form, then update)

<pre> { "study_name": "ABCP-2022-01_DEV1", "forms": [{ "site": "101", "study_country": "United States", "subject": "SCR-0002", "eventgroup_name": "egSCR", "eventgroup_sequence": 1, "event_name": "evSCR", "form_name": "DM", "form_sequence": 1, "items": [{ </pre>	<pre> { "responseStatus": "SUCCESS", "items": [{ "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "SCR-0002", "eventgroup_name": "egSCR", "eventgroup_sequence": 1, "event_name": "evSCR", "event_sequence": 1, "form_name": "DM", "form_sequence": 1, </pre>
---	--

Description / Request (URL)	Response
<pre> "itemgroup_name": "ig-DM", "itemgroup_sequence": 1, "item_name": "BRTHDAT", "value": "1981-03-03", "change_reason": "Updated by integration" }] } } </pre>	<pre> "itemgroup_name": "ig-DM", "itemgroup_sequence": 1, "item_name": "BRTHDAT", "value": "1981-03-03", "change_reason": "Updated by integration" }] } } </pre>
<p>PUT style (upsert)</p>	
<p>Other examples apply, except the response status indicates if the item was created (in an item group that was also created, or updated if it already exists). 'SUCCESS:UPDATED' is also returned if no changes were made.</p>	<pre> { "responseStatus": "SUCCESS", "items": [{ "responseStatus": "SUCCESS:CREATED", : : OR { "responseStatus": "SUCCESS", "items": [{ "responseStatus": "SUCCESS:UPDATED", : : </pre>

Flow Based Examples

Consider the **General Medical History** form of **Screening** visit of the example study:

The screenshot shows a web interface for a 'Screening (31-Aug-2021): General Medical History : Reference # 1 (1 of 3)' form. On the left, a sidebar lists study events: 'Screening 31-Aug-2021' (selected), 'Informed Consent', 'Demographics', 'Inclusion/Exclusion Criteria', 'Vital Signs', 'General Medical History (3)', 'Pregnancy Test', and 'Week 1 07-Sep-2021' (with sub-items 'Vital Signs' and 'Physical Examination'). The main form area is titled 'General Medical History' and contains three sections: 'Diagnosis' with a text input field and a '0 / 100' character count; 'Start Date' with a 'date' type input field; and 'Ongoing?' with radio buttons for 'No' and 'Yes'.

... it has 3 items on it. It is a repeating form, so **form_sequence** value in the API call is vital. There are no repeating item groups on the form, so **itemgroup_sequence** for each of the items is '1' (or can be omitted from the request)

The API body setting 2 of the 3 items:

POST <https://edc-services-internal.veevavault.com/api/v21.2/app/cdm/items>

Params Authorization Headers (12) **Body** Pre-request Script Tests Settings

● none ● form-data ● x-www-form-urlencoded ● **raw** ● binary ● GraphQL **JSON** ▾

```

1  {
2  ... "study_name": "CSM Demo Study_DEV1",
3  ... "forms": [
4  ... |
5  ... |   "study_country": "United States",
6  ... |   "site": "002",
7  ... |   "subject": "002-0001",
8  ... |   "eventgroup_name": "eg_SCREENING",
9  ... |   "eventgroup_sequence": 1,
10 ... |   "event_name": "ev_SCREENING",
11 ... |   "form_name": "MH",
12 ... |   "form_sequence": 1,
13 ... |   "items": [
14 ... |     {
15 ... |       "itemgroup_name": "MH",
16 ... |       "itemgroup_sequence": 1,
17 ... |       "item_name": "MHTERM",
18 ... |       "value": "This is the diagnosis"
19 ... |     },
20 ... |     {
21 ... |       "itemgroup_name": "MH",
22 ... |       "itemgroup_sequence": 1,
23 ... |       "item_name": "MHSTDAT",
24 ... |       "value": "2019-03-01"

```

Yields, in EDC UI:

Screening (31-Aug-2021): **General Medical History** : Reference # 1 (1 of 3) Complete

General Medical History

Diagnosis: 21 / 100

Start Date:

Ongoing? No Yes

The form is still in edit mode, to submit a form the Submit Form (next section) is called afterwards. There is not currently a parameter on the set items endpoint to also submit the form, although combination APIs are part of coming releases.

A 2nd API submit to the form, to set **Ongoing = No**, uses this additional section of the items JSON array:

```

24 | ..... | "value": "2019-03-01"
25 | ..... | },
26 | ..... | {
27 | ..... | "itemgroup_name": "MH",
28 | ..... | "itemgroup_sequence": 1,
29 | ..... | "item_name": "MHONGO",
30 | ..... | "value": "N"
31 | ..... | }

```

Importantly, the **N** value is from a codelist code of a study design, which can be found in the study SDS, or from Studio:

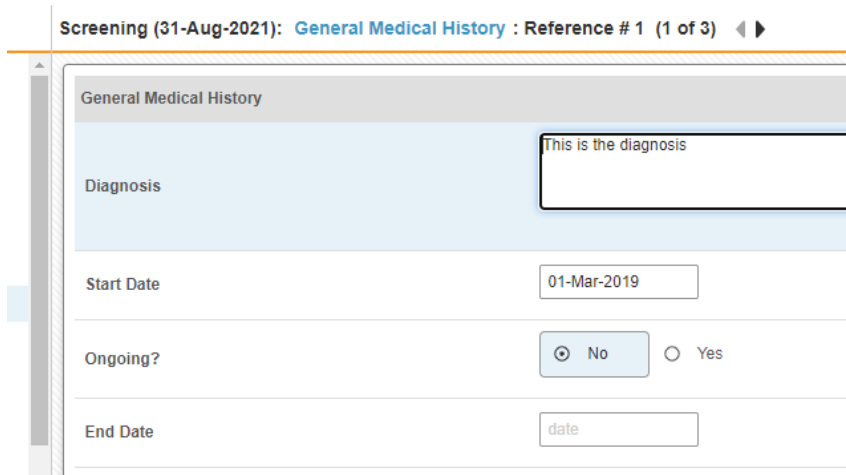

Edit Codelist

Name: External ID:

Description:

Code	Label	Description
N	No	
Y	Yes	

Dynamic fields are often part of form design, in this case, the set of Ongoing = **No**, unhides in the EDC UI a 4th field, **End Date**:

Although this form has been set with multiple API endpoint calls, it can be set – all 4 fields – in one endpoint call, even for fields that are hidden from view:

```

1 ..... form_sequence": 1,
2 ..... "items": [
3 ..... {
4 .....     "itemgroup_name": "MH",
5 .....     "itemgroup_sequence": 1,
6 .....     "item_name": "MHTERM",
7 .....     "value": "This is the diagnosis"
8 ..... },
9 ..... {
10 .....     "itemgroup_name": "MH",
11 .....     "itemgroup_sequence": 1,
12 .....     "item_name": "MHSTDAT",
13 .....     "value": "2019-03-01"
14 ..... },
15 ..... {
16 .....     "itemgroup_name": "MH",
17 .....     "itemgroup_sequence": 1,
18 .....     "item_name": "MHONGO",
19 .....     "value": "N"
20 ..... },
21 ..... ],
22 ..... {
23 .....     "itemgroup_name": "MH",
24 .....     "itemgroup_sequence": 1,
25 .....     "item_name": "MHENDAT",
26 .....     "value": "2020-01-31"
27 ..... }
28 ..... ]
29 ..... }

```

IMPORTANT: Always be reticent of any dynamic fields on the form. The set of Ongoing = **Y** (Yes) would be allowed, with an end date via the API endpoint, even though the data would not make sense per the form’s dynamic rules. For submitted forms (different API, next section), like:

Screening: General medical history

Reference #	Diagnosis	Start Date	Ongoing?	End Date
1	This is the diagnosis	01-Mar-2019	No	31-Jan-2020

... a reason for change will be required for any field update, after the first submit of the form. Additionally, the form won't allow edits when in submitted state. So, this attempt to update the **Diagnosis** field:

```

1 {
2   ...."study_name": "CSH Demo Study_DEV1",
3   ...."forms": [
4     .....
5     ...."study_country": "United States",
6     ...."site": "002",
7     ...."subject": "002-0001",
8     ...."eventgroup_name": "eg_SCREENING",
9     ...."eventgroup_sequence": 1,
10    ...."event_name": "ev_SCREENING",
11    ...."form_name": "MH",
12    ...."form_sequence": 1,
13    ...."items": [
14      .....{
15        ...."itemgroup_name": "MH",
16        ...."itemgroup_sequence": 1,
17        ...."item_name": "MHTERM",
18        ...."value": "Headaches",
19        ...."change_reason": "This is a custom reason for field value"
20      .....}
21    .....]
22  .....]
23 }

```

Is met with:

```

1 {
2   "responseStatus": "SUCCESS",
3   "items": [
4     {
5       "responseStatus": "FAILURE",
6       "errorMessage": "Items on submitted forms cannot be edited",
7       "study_country": "United States",
8       "site": "002",
9       "subject": "002-0001",
10      "eventgroup_name": "eg_SCREENING",
11      "eventgroup_sequence": 1,
12      "event_name": "ev_SCREENING",
13      "event_sequence": 1,
14      "form_name": "MH",
15      "form_sequence": 1,
16      "itemgroup_name": "MH",
17      "itemgroup_sequence": 1,
18      "item_name": "MHTERM",
19      "value": "Headaches",
20      "change_reason": "This is a custom reason for field value"
21    }
22  ]
23 }

```

With the form opened for edit (its API endpoint is later section), notice the **change_reason** parameter, which can be any text necessary to the update:

```

16     "itemgroup_sequence": 1,
17     "item_name": "MHTERM",
18     "value": "Headaches",
19     "change_reason": "This is a custom reason for field value"
20   }
21 }

```

.. is shown in the UI reason in the audit trail:

The screenshot shows the 'Item Audit Trail' section of the Vault CDMS interface. It features a table with the following data:

Timestamp (M/d/yyyy h:mm:ss a z)	User Name	Event Description
9/24/2021 9:54:19 AM EDT	Eric Emerton (eric.emerton@edc-services.com)	Value changed from "This is the diagnosis" to "Headaches". Reason for change: "This is a custom reason for field value".
9/24/2021 9:54:19 AM EDT	Eric Emerton (eric.emerton@edc-services.com)	Item Status changed from "Submitted" to "In Progress". Reason for change: "This is a custom reason for field value".
9/24/2021 9:48:58 AM EDT	System on behalf of Eric Emerton (eric.emerton@edc-services.com)	Item Status changed from "In Progress" to "Submitted". Reason for change: "Changes prior to submission".

To the right of the table, a form field for 'Headaches' is visible, showing a dropdown menu with 'Other (please specify)' selected and the value 'This is a custom reason for field value' entered in the text input area.

Next, consider the Vitals form, with unit codelist fields for Height, Weight, others:

The Height field definition:

.. with unit codelist HEIGHTU definition prescribing codes of only **CM** and **IN**:

	Standard	Name	Label	Abbreviation	Unit Conversion
<input checked="" type="radio"/>	<input checked="" type="radio"/>	CM	cm	cm	
<input type="radio"/>	<input type="radio"/>	IN	in	in	\$value__v *2.54

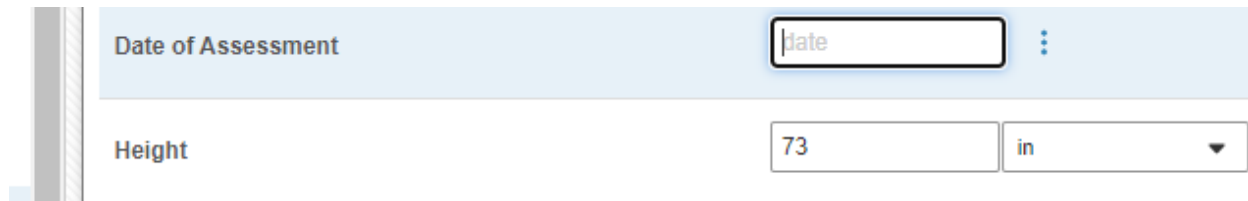

The API body to update the Height field, then, to set 73 Inches is:

```

1  {
2  ..... "study_name": "CSM Demo Study_DEV1",
3  ..... "forms": [
4  ..... {
5  ..... "study_country": "United States",
6  ..... "site": "002",
7  ..... "subject": "002-0001",
8  ..... "eventgroup_name": "eg_SCREENING",
9  ..... "eventgroup_sequence": 1,
10 ..... "event_name": "ev_SCREENING",
11 ..... "form_name": "VS",
12 ..... "form_sequence": 1,
13 ..... "items": [
14 ..... {
15 ..... "itemgroup_name": "VS",
16 ..... "itemgroup_sequence": 1,
17 ..... "item_name": "HEIGHT",
18 ..... "value": "73",
19 ..... "unit_value": "IN"
20 ..... }
21 ..... ]
22 ..... }

```

Yielding the EDC UI set as:

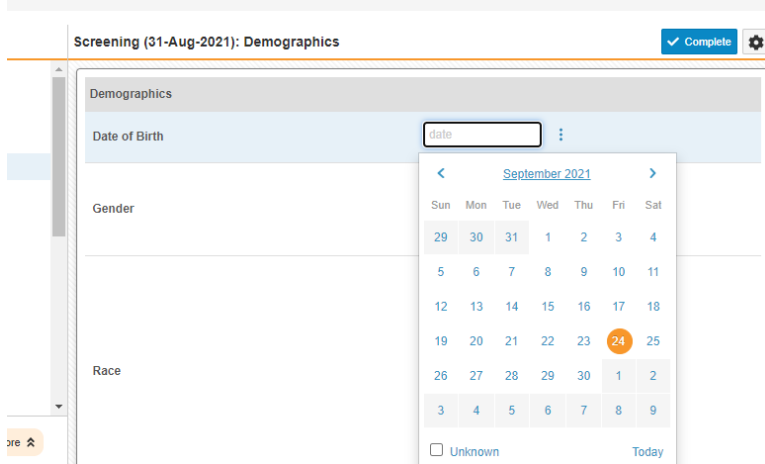

Although the definition of the field is 3 places for the whole number portion, and 1 for decimal, it is not required to enter '73.0' through the API. Attempting 73.12, though, violates the design of this field, and is met with this on attempt:

```

1  {
2  ..... "responseStatus": "SUCCESS",
3  ..... "items": [
4  ..... {
5  ..... "responseStatus": "FAILURE",
6  ..... "errorMessage": "This field only accepts 3 digit(s) before the decimal and 1 digit(s) after the decimal.",
7  ..... "study_country": "United States",
8  ..... "site": "002",
9  ..... "subject": "002-0001"

```

Next in consideration is fields that allow for unknown parts (dates / datetimes). The Date of Birth field is set with the property for both month and day:

The API body to set an unknown value for both Month and Day: (**UN** is used in each of the portions)

```

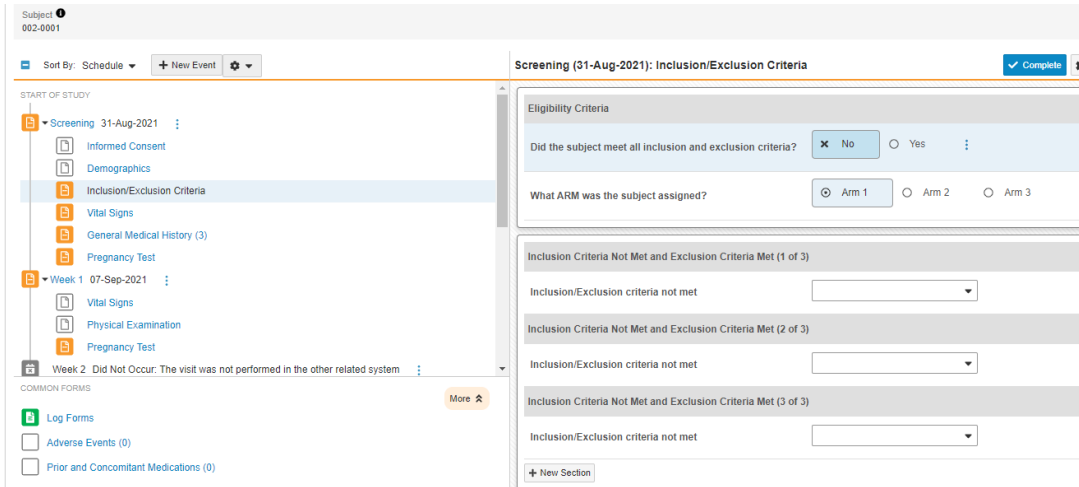

1  none  ● form-data  ● x-www-form-urlencoded  ● raw  ● binary  ● Graph
2  ...
3  ...
4  ...
5  ... "study_country": "United States",
6  ... "site": "002",
7  ... "subject": "002-0001",
8  ... "eventgroup_name": "eg_SCREENING",
9  ... "eventgroup_sequence": 1,
10 ... "event_name": "ev_SCREENING",
11 ... "form_name": "DM",
12 ... "form_sequence": 1,
13 ... "items": [
14 ... {
15 ...   "itemgroup_name": "DM",
16 ...   "itemgroup_sequence": 1,
17 ...   "item_name": "BRTHDAT",
18 ...   "value": "1980-UN-UN"
19 ... }
20 ... ]
21 ... }

```

.. which yields in EDC the UI formatted value of ? in the unknown parts. (? Is NOT used in the API call)

Next in consideration is forms with repeating item groups. This form in the example study has a non-repeating item group of summary information, then a repeating item group for criteria not met:

The pictured form has 3 item groups added, which can be done in separate API calls (see Add Item Groups or Upsert Item Groups sections). **Alternatively**, the Upsert Form Data (**PUT** used) will **automatically** run the upsert of item groups, adding any that are necessary for the data update.

This API body uses codelist codes for values, and identifies the item group by sequence for each value:

```

4 ..... {
5 .....   "study_country": "United States",
6 .....   "site": "002",
7 .....   "subject": "002-0001",
8 .....   "eventgroup_name": "eg_SCREENING",
9 .....   "eventgroup_sequence": 1,
10 .....  "event_name": "ev_SCREENING",
11 .....  "form_name": "IE",
12 .....  "form_sequence": 1,
13 .....  "items": [
14 .....    {
15 .....      "itemgroup_name": "IECAT",
16 .....      "itemgroup_sequence": 1,
17 .....      "item_name": "IETESTCD1",
18 .....      "value": "IN1"
19 .....    },
20 .....    {
21 .....      "itemgroup_name": "IECAT",
22 .....      "itemgroup_sequence": 2,
23 .....      "item_name": "IETESTCD1",
24 .....      "value": "IN14"
25 .....    },
26 .....    {
27 .....      "itemgroup_name": "IECAT",
28 .....      "itemgroup_sequence": 3,
29 .....      "item_name": "IETESTCD1",
30 .....      "value": "EXC2"
31 .....    }
32 .....  ]
33 ..... }
34 ..... ]

```

.. which yields the EDC UI result:

Eligibility Criteria

Did the subject meet all inclusion and exclusion criteria? No Yes ⋮

What ARM was the subject assigned? Arm 1 Arm 2 Arm 3

Inclusion Criteria Not Met and Exclusion Criteria Met (1 of 3)

Inclusion/Exclusion criteria not met

Inclusion Criteria Not Met and Exclusion Criteria Met (2 of 3)

Inclusion/Exclusion criteria not met

Inclusion Criteria Not Met and Exclusion Criteria Met (3 of 3)

Flow Based Examples

For an unsubmitted form the EDC UI:

-  [Demographics](#)
-  [Inclusion/Exclusion Criteria](#)
-  [Vital Signs](#)

The post to submit the form will run study design rules (potentially adding dynamic events/forms elsewhere in the study). The Inclusion / Exclusion is submitted with:

```

1  {
2  ..... "study_name": "CSM-Demo-Study_DEV1",
3  ..... "forms": [
4  ..... {
5  .....   "study_country": "United States",
6  .....   "site": "002",
7  .....   "subject": "002-0001",
8  .....   "eventgroup_name": "eg_SCREENING",
9  .....   "eventgroup_sequence": 1,
10 .....   "event_name": "ev_SCREENING",
11 .....   "form_name": "IE",
12 .....   "form_sequence": 1
13 ..... }
14 ..... ]
15 }

```

Body Cookies Headers (16) Test Results Status: 200 OK Ti

```

1  {
2  "responseStatus": "SUCCESS",
3  "forms": [
4  {
5  "responseStatus": "SUCCESS",
6  "study_country": "United States",
7  "site": "002",
8  "subject": "002-0001",
9  "eventgroup_name": "eg_SCREENING",
10 "eventgroup_sequence": 1,
11 "event_name": "ev_SCREENING",
12 "event_sequence": 1,
13 "form_name": "IE",
14 "form_sequence": 1

```

.. yielding the form in EDC UI:

Subject 002-0001

Sort By: Schedule + New Event

Screening (31-Aug-2021): Inclusion/Exclusion Criteria Edit Form

START OF STUDY

- Screening 31-Aug-2021
 - Informed Consent
 - Demographics
 - Inclusion/Exclusion Criteria**
 - Vital Signs
 - General Medical History (3)
 - Pregnancy Test
- Week 1 07-Sep-2021
 - Pregnancy Test
- Unscheduled Event 01-Sep-2021

END OF STUDY

COMMON FORMS More

- Log Forms

Eligibility Criteria

Did the subject meet all inclusion and exclusion criteria? No

What ARM was the subject assigned? Arm 1

Inclusion Criteria Not Met and Exclusion Criteria Met (1 of 3)

Inclusion/Exclusion criteria not met Inclusion Criteria 1

Inclusion Criteria Not Met and Exclusion Criteria Met (2 of 3)

Inclusion/Exclusion criteria not met Inclusion Criteria 14

IMPORTANT: When forms appear dynamically, based on answers of other forms, those forms must be submitted to run the rules that drive the appearance of the form. This example in EDC:

Sort By: Schedule + New Event

Screening 01-Sep-2021

START OF STUDY

- Screening 01-Sep-2021
 - Informed Consent
 - Demographics
 - Inclusion/Exclusion Criteria
 - Vital Signs
 - General Medical History (0)
 - Pregnancy Test

END OF STUDY

COMMON FORMS More

change_reason	forms	Required	The reason to be applied as part of opening the form for edit																																										
Notes	<ul style="list-style-type: none"> The action is for opening a form back up, i.e., to further edit data on the form. Currently there is no parameter on the set items (updating a form) to also open the form conditionally for edit (should it be in submitted state). Inspection of the current state of the form is suggested. A coming release will include combination API(s) that do multiple actions, i.e. open a form (if it needs opening), setting data, submitting, as one API call. The parameter change_reason in the body is required for opening a form and will be added to the audit trail of the form. WARNING: Any form in frozen or locked status cannot be opened for edit via the API. There is no current API to unfreeze or unlock. These actions were human based decisions, and CDMS stance is that one should not be able to override that via an API call 																																												

Examples

Description / Request (URL)	Response

The vault picklist name is used - one of: open__v answered__v reopened__v closed__v	event_name	Optional	Design name in the study of the event to filter to	last_modified_date		Filter to subject's modified since a certain date. Format: yyyy-MM-ddTHH:mm:ssZ	limit	Optional	Pagination API - different limit from the default 1000 can be used	offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd
Name	Req/Opt	Notes																																
study_name	Required	Name of the study																																
study_country	Required	Name of the study country (of the subject's site)																																
site	Required	Name/number of the site																																
subject	Required	Subject to act on																																
form_name	Optional	Design name in the study of form to filter return of queries, i.e. queries that reside on that form only																																
query_status	Optional	Filter for the current status of the queries. The vault picklist name is used - one of: open__v answered__v reopened__v closed__v																																
event_name	Optional	Design name in the study of the event to filter to																																
last_modified_date		Filter to subject's modified since a certain date. Format: yyyy-MM-ddTHH:mm:ssZ																																
limit	Optional	Pagination API - different limit from the default 1000 can be used																																
offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd																																
Notes	<ul style="list-style-type: none"> ● Use this API to retrieve the existing queries of a study ● Return specific subsets based on various filtering options. ● If filtered by site / subject, the 'level above' must also be included. Example: if filtering by a site, it's study country must also be included ● The return value manual is such that false = added by the system. ● When the query was added via a specific design rule, the rule_definition indicates the name of the rule that originated the query. ● Queries are added at the item or event level. For event level, the form 'down' information is of course omitted ● The return includes a messages array with each comment/message appended to the query. Reading top down in that array also reveals the progression of query status, and by whom ● With known query ID(s) - perhaps stored as the API added queries - use of the Retrieve Queries - By ID endpoint is more straightforward.

10.10 Close Queries - By Query ID

Help Main	https://developer-cdms.veevavault.com/api/22.2/#close-query-batch																		
Style	POST																		
Endpoint	<your Vault URL>/api/v22.2/app/cdm/queries/actions/closebyid																		
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Array</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>study_name</td> <td></td> <td>Required</td> <td>Name of the study</td> </tr> <tr> <td>id</td> <td>queries</td> <td>Required</td> <td>The Vault ID of the query. This value is returned on add (if added by API), and also on Get Queries endpoint return of the query.</td> </tr> <tr> <td>message</td> <td>queries</td> <td>Optional</td> <td>The message of the query on close, optional (255 character limit)</td> </tr> </tbody> </table>			Name	Array	Req/Opt	Notes	study_name		Required	Name of the study	id	queries	Required	The Vault ID of the query. This value is returned on add (if added by API), and also on Get Queries endpoint return of the query.	message	queries	Optional	The message of the query on close, optional (255 character limit)
Name	Array	Req/Opt	Notes																
study_name		Required	Name of the study																
id	queries	Required	The Vault ID of the query. This value is returned on add (if added by API), and also on Get Queries endpoint return of the query.																
message	queries	Optional	The message of the query on close, optional (255 character limit)																
Notes	<ul style="list-style-type: none"> • The action is used to answer an existing query, via known query ID(s). • There is a limit of 500 per request. • The action applies whether the query is against an item (on a form), or an event • The query must be in Answered status to perform this action • WARNING: A locked form will not allow the editing of a query, just at the EDC UI would disallow. Frozen forms will accept the edit added via the API. • One can also answer a query by subject information / study design also - see the previous section Close Queries - By Study Design Context. The endpoint for study context originally included a 'By ID' style, but that is to be deprecated in favor of this endpoint (../actions/closebyid) • TIP: If query IDs are known (returned in Retrieve Queries), then use of this option By ID is preferred. 																		

Examples

Description / Request (URL)	Response
Close of one query (with message)	
<pre>{ "study_name": "ABCP-2022-01_DEV1", "queries": [{ "id": "OPW00000014003", "message": "Closed Query via API - by ID" }] }</pre>	<pre>{ "responseStatus": "SUCCESS", "queries": [{ "responseStatus": "SUCCESS", "id": "OPW00000014003", "message": "Closed Query via API - by ID", "query_status": "closed_v", }] }</pre>

10.11 Reopen Queries - By Study Context

Help Main	https://developer-cdms.veevavault.com/api/22.2/#reopen-query																																																								
Style	POST																																																								
Endpoint	<your Vault URL>/api/v22.2/app/cdm/queries/actions/reopen																																																								
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Array</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>study_name</td> <td></td> <td>Required</td> <td>Name of the study</td> </tr> <tr> <td>study_country</td> <td>queries</td> <td>Required</td> <td>Name of the study country (of the subject's site)</td> </tr> <tr> <td>site</td> <td>queries</td> <td>Required</td> <td>Name/number of the site</td> </tr> <tr> <td>subject</td> <td>queries</td> <td>Required</td> <td>Subject to act on</td> </tr> <tr> <td>eventgroup_name</td> <td>queries</td> <td>Required</td> <td>Design name in the study of the event group</td> </tr> <tr> <td>eventgroup_sequence</td> <td>queries</td> <td>Optional</td> <td>The specific sequence of an event group. 1 assumed if omitted</td> </tr> <tr> <td>event_name</td> <td>queries</td> <td>Required</td> <td>Design name in the study of the event</td> </tr> <tr> <td>form_name</td> <td>queries</td> <td>Optional *</td> <td>Design name in the study of the form. Required when query is on an item on a form</td> </tr> <tr> <td>form_sequence</td> <td>queries</td> <td>Optional *</td> <td>The specific sequence of the form. (if a query on an item of a form) 1 assumed if omitted.</td> </tr> <tr> <td>itemgroup_name</td> <td>queries</td> <td>Optional *</td> <td>Design name in the study of the item group location. 11 Medical Coding

11.1 Retrieve Coding Requests

Help Main	https://developer-cdms.veevavault.com/api/22.2/#retrieve-coding-requests																											
Style	GET																											
Endpoint	<your Vault URL>/api/v22.2/app/cdm/coder/codingrequests																											
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>study_name</td> <td>Required</td> <td>Name of the study</td> </tr> <tr> <td>coding_item_definition</td> <td>Required</td> <td>See the Study Design -> Retrieve Coding Form Definitions for retrieving these values. There, the coding_item_definition_name is the value to use into this endpoint.</td> </tr> <tr> <td>study_country</td> <td>Optional</td> <td>Name of the study country (of the subject's site)</td> </tr> <tr> <td>site</td> <td>Optional</td> <td>Name/number of the site, requires study country (of the site) if using</td> </tr> <tr> <td>subject</td> <td>Optional</td> <td>Subject number, requires country and site if using</td> </tr> <tr> <td>last_modified_date</td> <td></td> <td>Filter to coding requests modified since a certain date. Format: yyyy-MM-ddTHH:mm:ssZ</td> </tr> <tr> <td>limit</td> <td>Optional</td> <td>Pagination API - different limit from the default 1000 can be used</td> </tr> <tr> <td>offset</td> <td>Optional</td> <td>Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd</td> </tr> </tbody> </table>	Name	Req/Opt	Notes	study_name	Required	Name of the study	coding_item_definition	Required	See the Study Design -> Retrieve Coding Form Definitions for retrieving these values. There, the coding_item_definition_name is the value to use into this endpoint.	study_country	Optional	Name of the study country (of the subject's site)	site	Optional	Name/number of the site, requires study country (of the site) if using	subject	Optional	Subject number, requires country and site if using	last_modified_date		Filter to coding requests modified since a certain date. Format: yyyy-MM-ddTHH:mm:ssZ	limit	Optional	Pagination API - different limit from the default 1000 can be used	offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd
Name	Req/Opt	Notes																										
study_name	Required	Name of the study																										
coding_item_definition	Required	See the Study Design -> Retrieve Coding Form Definitions for retrieving these values. There, the coding_item_definition_name is the value to use into this endpoint.																										
study_country	Optional	Name of the study country (of the subject's site)																										
site	Optional	Name/number of the site, requires study country (of the site) if using																										
subject	Optional	Subject number, requires country and site if using																										
last_modified_date		Filter to coding requests modified since a certain date. Format: yyyy-MM-ddTHH:mm:ssZ																										
limit	Optional	Pagination API - different limit from the default 1000 can be used																										
offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd																										
Notes	<ul style="list-style-type: none"> • Use this API to retrieve the medical coding requests • Required is the coding_item_definition (e.g., AE, CM, etc.). Only one coding form (its requests) can be returned at once. To get the appropriate value for the study / coding item definition, use the endpoint Study Design -> Retrieve Coding Form Definitions. Specifically the response parameter: coding_item_definition_name • Filter for requests modified since a point is done is done with the last_modified_date parameter. The format is: yyyy-MM-ddTHH:mm:ssZ

Flow Based Examples

These medical coding requests in the Coder UI

The screenshot shows the Coder UI interface. At the top, there are navigation tabs: Data Entry, Library, Studio, Review, Assessments, Coder, Reports, Dashboards, Labs, Loader, and Randomization. The current view is for 'Oriol_Test2_DEV1 - AE'. Below this, there are filters for Coding Status (All), Query Status (All), Site (All), and Subject (All). A table displays coding requests with columns: Verbatim, Seriousness, Coding Status, Assigned Code, Site, Subject, Query Status, and Query Age (D). Three requests are shown: Cough (OPEN), Headache (OPEN), and Headache (AUTOCODED). The AUTOCODED request is highlighted. To the right, a sidebar shows 'HEADACHE' with 'ASSIGNED CODE' and a list of terms like '10019211 Headache'. Below the table is a 'Dictionary' section with search filters and a table of code options including LLT, PT, HLT, HLGT, and SOC.

Are retrieved with this API GET:

The screenshot shows a REST client interface with the following details:

- Method:** GET
- URL:** `https://edc-services-internal.veevavault.com/api/v21.2/app/cdm/coder/codingrequests?study_name=Oriol_Test2_DEV1&coding_item_definition=VV-000010`
- Params:** Authorization, Headers (8), Body, Pre-request Script, Tests, Settings
- Query Params:**

KEY	VALUE	DESCRIPTION
<input checked="" type="checkbox"/> study_name	Oriol_Test2_DEV1	
<input checked="" type="checkbox"/> coding_item_definition	VV-000010	
Key	Value	Description
- Body:** Status: 200 OK, Time: 518 ms, Size: 4.76 KB
- Response Format:** Pretty (JSON)
- Response Content:**

```

1  {
2    "responseStatus": "SUCCESS",
3    "codingrequests": [
4      {
5        "coding_item_definition": "V0V000000009001",
6        "form_status": "Active",
7        "form_type": "AE",
8        "dictionary_definition": "MedDRA",
9        "requests": [
10       {
11         "id": "V1000000006001",
12         "site": "100",
13         "subject": "SCR-0002",
14         "verbatim": "Headache",
15         "start_date": "2021-05-01T00:00:00Z",
16         "stop_date": "",
17         "event": "Screening",
18         "event_sequence": 1,
19         "form": "Adverse Events",
20         "form_sequence": 1,
21         "item_group": null,
22         "item_group_sequence": 1,
23         "item": null,
24         "coding_status": "Autocoded",
25         "last_coded_by_third_party": "",
26         "last_coded_date": "2021-05-14T10:06:25Z",
27         "assigned_to_third_party": ""

```

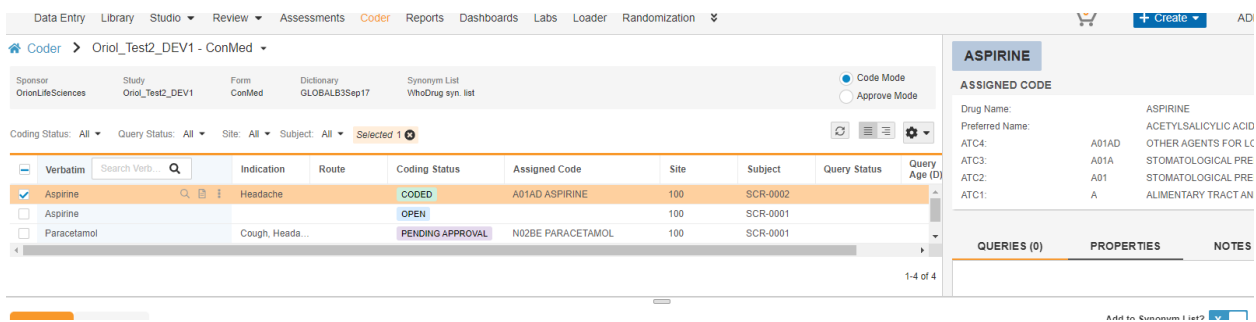

Further down the return is the coding for the AE:

```

30     "created_by": "System",
31     "other_properties": {
32       "Other Action Taken": null
33     },
34     "seriousness": "",
35     "severity": "",
36     "llt_code": "10019211",
37     "llt": "Headache",
38     "pt_code": "10019211",
39     "pt": "Headache",
40     "hlt_code": "10019233",
41     "hlt": "Headaches NEC",
42     "higt_code": "10019231",
43     "higt": "Headaches",
44     "soc": "Nervous system disorders",
45     "soc_code": "10029205",
46     "primary_path": "Y"
47   },
48 }

```

For WHODrug requests (ConMeds, etc.), in EDC we see coding:

The screenshot shows the EDC Coder interface for a study named 'Oriol_Test2_DEV1 - ConMed'. The main table displays coding information for Aspirin, including its indication (Headache), route, coding status (CODED), assigned code (A01AD ASPIRINE), site (100), and subject (SCR-0002). A right-hand panel provides detailed information for the assigned code 'ASPIRINE', listing its preferred name and various ATC codes (ATC4, ATC3, ATC2, ATC1).

Verbatim	Search Verb	Indication	Route	Coding Status	Assigned Code	Site	Subject	Query Status	Query Age (D)
<input checked="" type="checkbox"/>	Aspirine	Headache		CODED	A01AD ASPIRINE	100	SCR-0002		
<input type="checkbox"/>	Aspirine			OPEN		100	SCR-0001		
<input type="checkbox"/>	Paracetamol	Cough, Head...		PENDING APPROVAL	N02BE PARACETAMOL	100	SCR-0001		

Returned in API for detail of coding as:

```

24     "coding_status": "Coded",

11.2 Retrieve Coding Queries

Help Main	https://developer-cdms.veevavault.com/api/22.2/#retrieve-coding-queries															
Style	GET															
Endpoint	<your Vault URL>/api/v22.2/app/cdm/queries															
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>study_name</td> <td>Required</td> <td>Name of the study</td> </tr> <tr> <td>coding_item_definition</td> <td>Required</td> <td>See the Study Design -> Retrieve Coding Form Definitions for retrieving these values. There, the coding_item_definition_id is the value to use into this endpoint.</td> </tr> <tr> <td>limit</td> <td>Optional</td> <td>Pagination API - different limit from the default 1000 can be used</td> </tr> <tr> <td>offset</td> <td>Optional</td> <td>Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd</td> </tr> </tbody> </table>	Name	Req/Opt	Notes	study_name	Required	Name of the study	coding_item_definition	Required	See the Study Design -> Retrieve Coding Form Definitions for retrieving these values. There, the coding_item_definition_id is the value to use into this endpoint.	limit	Optional	Pagination API - different limit from the default 1000 can be used	offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd
Name	Req/Opt	Notes														
study_name	Required	Name of the study														
coding_item_definition	Required	See the Study Design -> Retrieve Coding Form Definitions for retrieving these values. There, the coding_item_definition_id is the value to use into this endpoint.														
limit	Optional	Pagination API - different limit from the default 1000 can be used														
offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd														
Notes	<ul style="list-style-type: none"> ● Use this API to retrieve the existing queries of a specific ID (or IDs). The ID of the query is returned on add via the API, or from Retrieve Queries endpoint. ● The return value manual is such that false = added by the system. ● When the query was added via a specific design rule, the rule_definition indicates the name of the rule that originated the query. ● Queries are added at the item or event level. For event level, the form 'down' information is of course omitted ● For the coding_item_definition parameter, the appropriate value for the study / coding item definition, use the endpoint Study Design -> Retrieve Coding Form Definitions. Specifically the response parameter: coding_item_definition_id ● The return includes a messages array with each comment/message appended to the query. Reading top down in that array also reveals the progression of query status, and by whom ● Additional filtering / retrieval of queries is discussed in other sections (By Filters or By Medical Coding Definition, see Queries chapter) 															

Examples

12 Jobs

12.1 Jobs / Data Extracts Overview

Currently the main full extract of the CDMS system (a study) is the **Study Data Extract**, itself a job inside the CDMS **EDC Tools** area -> **Jobs** tab. The job run yields a zip file that is cumulative of the entire study. This section will discuss the start / retrieve status / get file of this type of job, primarily, but also catalog other data export job types. There are additionally targeted data retrieval endpoints discussed in early sections of this document ([Retrieve Events / Forms](#) and [Retrieve Forms / Item Data](#)), but these are not meant for the retrieval of large amounts of data, i.e. across the entire study. Their purpose is for 'inspect before update' needs. Attempts to get wide slices of study data should work through the jobs, and their resulting zip files.

NOTE: There is no current incremental based export, it is a planned feature of CDMS, accompanied by API endpoints to drive.

The current CDMS study job types for extracting data:

Job Type	API Value	Notes
Study Data Export (SDE)	study_data_export__v	The full data export for a study. Includes the form data (e.g., AE, CM, DM) however that is configured, as well as operational datasets (SYS_* in name). The job can be run on a subset of datasets. Full details at: CDMS Help
Subject Progress Listing	subject_progress_listing__v	Operational listing of the study. Each row is a subject, with counts of progress of the subject. The job cannot be run in subsets.
Event Progress Listing	event_progress_listing__v	Operational listing of the study. Each row is an event, detailing that event status, date, and other information. The job cannot be run in subsets.
Form Progress Listing	form_progress_listing__v	Operational listing of the study. Each row is a form, detailing that form status, form properties, and other information. The job cannot be run in subsets.
Query Detail Listing	query_detail_listing__v	Operational listing of the study. Each row is a query in the study, detailing that status, cycle times, and other information. The job cannot be run in subsets.
Core Listings	core_listing__v	A predecessor of the SDE, only the form data listings, and of a different format than the SDE. The job can be run on a subset of data.
Data and Definitions	data_and_definition_export__v	A predecessor of the SDE, the data and definition file formats are different from the SDE. The job cannot be run in subsets.

As background to study jobs, and in the context of the **Study Data Extract (SDE)**, the tab for **EDC Tools** (for roles that have rights):

.. then selecting a study:

LB_BDOSC.csv	Microsoft Excel Comma S...	1 KB	No	1 KB	39%
LB_CTDNA.csv	Microsoft Excel Comma S...	1 KB	No	1 KB	40%

The above zip file contains CSV, and often .sas7bdat files, as well as a definition file set to describe the export. It's the means of full export of all data in a study, not specific API calls. It does include various SYS_* named datasets, operational study data, that does not change per study design:

JOBID.csv	Microsoft Excel Comma S...	1 KB	No
SYS_EVT.csv	Microsoft Excel Comma S...	1 KB	No
SYS_FORM.csv	Microsoft Excel Comma S...	2 KB	No
SYS_ILB.csv	Microsoft Excel Comma S...	1 KB	No
SYS_LINKS.csv	Microsoft Excel Comma S...	1 KB	No
SYS_PD.csv	Microsoft Excel Comma S...	1 KB	No
SYS_Q.csv	Microsoft Excel Comma S...	2 KB	No
SYS_QT.csv	Microsoft Excel Comma S...	1 KB	No
SYS_SITE.csv	Microsoft Excel Comma S...	1 KB	No
SYS_SUB.csv	Microsoft Excel Comma S...	1 KB	No
TL.csv	Microsoft Excel Comma S...	1 KB	No

More specific information on the format / files can be found at: <https://cdmshelp.veeva.com/gr/study-administrators/study-data-extracts/>

Retrieval options for the SDE zip file:

Option A: Vault FTP folder, through general FTPS connection. (Port 21, FTPS client software or other automation). The requires the setup of the FTP connector in EDC Tools, and selection at time of running the job (ad-hoc or scheduled)

Option B: Use of the Vault API for working with FTP folder, see also the next section of this document.

Option C: Use of the Get Job Output File endpoint, through the CDMS API endpoint.

12.2 Working with Vault FTP Folders Using Vault API

If the SDE or other similar extract jobs have a destination of the Veeva FTP location (also known as 'File Staging'), then one can use the SDE job zip delivered there through its otherwise recurring schedule. This alleviates the need to drive the start of the job / retrieve status, etc.

The main reference for Vault API, working with its FTP folders can be found here:

<https://developer.veevavault.com/api/22.2/#file-staging>. The intent is to work with FTP folders, but via a REST API, instead of traditional FTPS / port 21 connections.

With the EDC Job configured to send the resulting SDE to an FTP, and viewing through an FTP tool like Filezilla:

icts" ...
ssful

Remote site: /u1030863/StudyDataExtracts			
Filename	Filesize	Filetype	
..			
CSM_Demo_Study_DEV1_Study_Data_Extract_2021_09_27_10_56_EDT.zip	36,769	Compresse..	
MyOtherFolder		File folder	

... we can use the API to retrieve files from that location (<https://developer.veevavault.com/api/22.2/#list-items-at-a-path>), using a REST call like:

[.../api/v22.2/services/file_staging/items/u1030863/StudyDataExtracts?recursive=true](https://developer.veevavault.com/api/v22.2/services/file_staging/items/u1030863/StudyDataExtracts?recursive=true)

The return of the REST endpoint with recursive=true includes folders, and all files within:

```

1  [
2  "responseStatus": "SUCCESS",
3  "data": [
4    {
5      "kind": "file",
6      "path": "/u1030863/StudyDataExtracts/CSM_Demo_Study_DEV1_Study_Data_Extract_2021_09_27_10_56_EDT.zip",
7      "name": "CSM_Demo_Study_DEV1_Study_Data_Extract_2021_09_27_10_56_EDT.zip",
8      "size": 36769,
9      "modified_date": "2021-09-27T15:31:04.000Z"
10     },
11     {
12       "kind": "folder",
13       "path": "/u1030863/StudyDataExtracts/MyOtherFolder",
14       "name": "MyOtherFolder"
15     },
16     {
17       "kind": "file",
18       "path": "/u1030863/StudyDataExtracts/MyOtherFolder/CSM_Demo_Study_DEV1_Study_Data_Extract_2021_09_27_10_56_EDT.zip",
19       "name": "CSM_Demo_Study_DEV1_Study_Data_Extract_2021_09_27_10_56_EDT.zip",
20       "size": 36769,
21       "modified_date": "2021-09-27T15:31:32.000Z"
22     }
23   ]
24 ]

```

Then, use the REST endpoint to stream the file(s), see the reference: <https://developer.veevavault.com/api/22.2/#get-item-content>

12.3 Retrieve Recently Finished Jobs

If the API caller is **NOT** starting the SDE job, waiting, and retrieving that job's output zip file, then one needs to poll the study, its recently finished jobs. That is, one can schedule a nightly job through the **EDC Tools** UI, and an API caller can simply inspect those jobs to retrieve output files (zip) for these jobs.

IMPORTANT NOTE: THIS APPROACH IS TEMPORARY. It will be replaced by a formal CDMS endpoint for getting study jobs, and across multiple studies. The records of the EDC Tools -> Jobs tab are in a vault object: (**edc_job__v**), essentially the **EDC Tools -> Jobs** tab

Name	EDC Job Status	EDC Job Type	Study	Vault Job	Created Date
VV-000383	Completed	Study Data Extract	CSM Demo Study_DEV1	104,572	9/27/2021 10:56 AM EDT
VV-000379	Completed	Core Listing	CSM Demo Study_DEV1	104,301	9/24/2021 12:51 PM EDT
VV-000200	Completed	Study Data Extract	CSM Demo Study_DEV1	86,807	4/6/2021 12:07 PM EDT
VV-000186	Completed	Core Listing	CSM Demo Study_DEV1	85,701	3/16/2021 2:19 PM EDT

A Vault VQL statement can be run against a study and job type:

```
.../api/v22.2/query?q=SELECT id, vault_job__v, edc_job_type__v, edc_job_status__v, modified_date__v from edc_job__v where study__vr.name__v='CSM Demo Study_DEV1' and edc_job_status__v='completed__v' and edc_job_type__v='study_data_extract__v' order by modified_date__v desc
```

...yielding just the SDE type, and those now completed, and latest at beginning of the return:

```

{
  "responseStatus": "SUCCESS",
  "responseDetails": {
    "pagesize": 1000,
    "pageoffset": 0,
    "size": 2,
    "total": 2
  },
  "data": [
    {
      "id": "OQH00000048001",
      "vault_job__v": 104572,
      "edc_job_type__v": [
        "study_data_extract__v"
      ],
      "edc_job_status__v": [
        "completed__v"
      ],
      "modified_date__v": "2021-09-27T14:57:03.000Z"
    },
    {
      "id": "OQH00000029006",
      "vault_job__v": 86807,
      "edc_job_type__v": [
        "study_data_extract__v"
      ],
      "edc_job_status__v": [
        "completed__v"
      ],
      "modified_date__v": "2021-04-06T12:07:00.000Z"
    }
  ]
}

```

The **vault_job__v** value in the return is the value to use in the endpoint discussed later in this document - [Retrieve Job Output File](#)

12.4 Start Study Job - SDE

Help Main	https://developer-cdms.veevavault.com/api/22.2/#start-job-sde																																																																														
Style	POST																																																																														
Endpoint	<your Vault URL>/api/v22.2/app/cdm/jobs/start_now

Style	POST																		
Endpoint	<your Vault URL>/api/v22.2/app/cdm/jobs/start_now																		
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Req/Opt</th> <th>Default (when omitted)</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>study_name</td> <td>Required</td> <td></td> <td>Name of the study</td> </tr> <tr> <td>job_type</td> <td>Required</td> <td></td> <td>For this job type, the value is always data_and_definition_export_v</td> </tr> <tr> <td>include_restricted_data</td> <td>Optional</td> <td>false</td> <td>Boolean - whether to include data that is otherwise on restricted forms. The API caller must have this permission to use true.</td> </tr> </tbody> </table>			Name	Req/Opt	Default (when omitted)	Notes	study_name	Required		Name of the study	job_type	Required		For this job type, the value is always data_and_definition_export_v	include_restricted_data	Optional	false	Boolean - whether to include data that is otherwise on restricted forms. The API caller must have this permission to use true .
Name	Req/Opt	Default (when omitted)	Notes																
study_name	Required		Name of the study																
job_type	Required		For this job type, the value is always data_and_definition_export_v																
include_restricted_data	Optional	false	Boolean - whether to include data that is otherwise on restricted forms. The API caller must have this permission to use true .																
Notes	<ul style="list-style-type: none"> This export is a predecessor to the SDE, of a different format. It only returns CSVs of form data When the study job starts, the vault job ID is returned to the caller. The caller then uses that to check job status, and eventually retrieve the file of the job 																		

Examples

Description / Request (URL)	Response
<p>Run the Job</p> <pre>{ "study_name": "ABCP-2022-01_DEV1", "request": { "job_type": "data_and_definition_export_v", "include_restricted_data": false } }</pre>	<pre>{ "responseStatus": "SUCCESS", "response": { "job_type": "data_and_definition_export_v", "job_id": 307579, "created_by": "eric.emerton@eke.com", "created_date": "2022-06-27T20:23:24Z", "include_restricted_data": false } }</pre>

12.11 Retrieve Job Status

Help Main	https://developer-cdms.veevavault.com/api/22.2/#retrieve-job-status						
Style	GET						
Endpoint	<your Vault URL>/api/v22.2/app/cdm/jobs/{ job_id }						
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>job_id</td> <td>Required</td> <td>The vault job ID. This value is embedded in the endpoint / URL. These job IDs are received on the start of a job, or via a query of study jobs.</td> </tr> </tbody> </table>	Name	Req/Opt	Notes	job_id	Required	The vault job ID. This value is embedded in the endpoint / URL. These job IDs are received on the start of a job, or via a query of study jobs.
Name	Req/Opt	Notes					
job_id	Required	The vault job ID. This value is embedded in the endpoint / URL. These job IDs are received on the start of a job, or via a query of study jobs.					
Notes	<ul style="list-style-type: none"> • Use this endpoint to determine the current status of a CDMS study job, i.e. waiting for a job to finish. • Only the job types mentioned in the Jobs / Data Extracts Overview section of this chapter can use this endpoint. 						

Possible Job Statuses

Status	API Value	Notes
In Progress	in_progress__v	The job is currently running
Completed	completed__v	The overall job finished. WARNING: This does not mean the job was 100% successful. Once should parse / examine the logs and output files of the job to verify their content and indication of errors for that job type.
Failed	failed__v	The overall job failed. The finer details of the failure are likely in files / logs the job generates.
Canceled	canceled__v	The job was / is canceled
Canceling	canceling__v	An API call was done to cancel the job (see next section), and the job is still in the process of canceling. Once complete, the status will move to canceled__v

Examples

Description / Request (URL)	Response
Get status for a job	
<pre>..api/{{version}}/app/cdm/jobs/305610</pre>	<pre>{ "responseStatus": "SUCCESS", "job_type": "study_data_extract__v", "response": { "job_id": 305610, "study_name": "ABCP-2022-01_DEV1", "status": "canceled__v", "created_by": "eric.emerton@eek.com", "created_date": "2022-06-17T18:32:15Z", "last_modified_date": "2022-06-17T18:32:58Z" } }</pre>

12.12 Cancel Job

Help Main	https://developer-cdms.veevavault.com/api/22.2/#cancel-job						
Style	POST						
Endpoint	<your Vault URL>/api/v22.2/app/cdm/jobs/{job_id}/cancel_now						
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>job_id</td> <td>Required</td> <td>The vault job ID. This value is embedded in the endpoint / URL. These job IDs are received on the start of a job, or via a query of study jobs.</td> </tr> </tbody> </table>	Name	Req/Opt	Notes	job_id	Required	The vault job ID. This value is embedded in the endpoint / URL. These job IDs are received on the start of a job, or via a query of study jobs.
Name	Req/Opt	Notes					
job_id	Required	The vault job ID. This value is embedded in the endpoint / URL. These job IDs are received on the start of a job, or via a query of study jobs.					
Notes	<ul style="list-style-type: none"> • Use this endpoint to cancel a CDMS study job that is currently running / in progress • Once the job goes to completed (or canceled), an error will be returned on the attempt • Only the job types mentioned in the Jobs / Data Extracts Overview section of this chapter can use this endpoint. 						

Examples

Description / Request (URL)	Response
Cancel successful	
<pre>../api/{version}/app/cdm/jobs/305610/cancel_now</pre>	<pre>{ "responseStatus": "SUCCESS", "response": { "job_type": "study_data_extract_v", "job_id": 305610, "study_name": "ABCP-2022-01_DEV1" } }</pre>
Cancel yields an error	
<pre>../api/{version}/app/cdm/jobs/305610/cancel_now</pre>	<pre>{ "responseStatus": "FAILURE", "errorMessage": "[Job] with status [canceled_v] is not cancellable" }</pre>

12.13 Retrieve Job Output Log

Help Main	https://developer-cdms.veevavault.com/api/22.2/#retrieve-job-log						
Style	GET						
Endpoint	<your Vault URL>/api/v22.2/app/cdm/jobs/{job_id}/file/log						
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>job_id</td> <td>Required</td> <td>The vault job ID. This value is embedded in the endpoint / URL. These job IDs are received on the start of a job, or via a query of study jobs.</td> </tr> </tbody> </table>	Name	Req/Opt	Notes	job_id	Required	The vault job ID. This value is embedded in the endpoint / URL. These job IDs are received on the start of a job, or via a query of study jobs.
Name	Req/Opt	Notes					
job_id	Required	The vault job ID. This value is embedded in the endpoint / URL. These job IDs are received on the start of a job, or via a query of study jobs.					
Notes	<ul style="list-style-type: none"> • Use this endpoint to retrieve the Vault job log for a CDMS study job • The output is text format and is high level information only. The job type will dictate more warnings / errors in log files it produces (contained in the output file, zip) • Only the job types mentioned in the Jobs / Data Extracts Overview section of this chapter can use this endpoint. 						

Examples

12.14 Retrieve Job Output File

Help Main	https://developer-cdms.veevavault.com/api/22.2/#retrieve-job-output-file						
Style	GET						
Endpoint	<your Vault URL>/api/v22.2/app/cdm/jobs/{ job_id }/file/content						
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>job_id</td> <td>Required</td> <td>The vault job ID. This value is embedded in the endpoint / URL. These job IDs are received on the start of a job, or via a query of study jobs.</td> </tr> </tbody> </table>	Name	Req/Opt	Notes	job_id	Required	The vault job ID. This value is embedded in the endpoint / URL. These job IDs are received on the start of a job, or via a query of study jobs.
Name	Req/Opt	Notes					
job_id	Required	The vault job ID. This value is embedded in the endpoint / URL. These job IDs are received on the start of a job, or via a query of study jobs.					
Notes	<ul style="list-style-type: none"> • Use this endpoint to retrieve the CDMS study job output file, e.g. a zip file of export content • Only a job with status completed__v can run this endpoint • WARNING: Depending on the job type, additional logs could be included in the output zip file, with indications of warnings and/or failures. Always read these files for true status of the job • Only the job types mentioned in the Jobs / Data Extracts Overview section of this chapter can use this endpoint. 						

Examples

Description / Request (URL)	Response
Get of job output file	
../api/{version}/app/cdm/jobs/305510/file/content	(not shown, the stream of a zip file, typically)

13 Users

13.1 Retrieve Users

Help Main	https://developer-cdms.veevavault.com/api/22.2/#retrieve-users															
Style																
Endpoint	<your Vault URL>/api/v22.2/app/cdm/users															
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>study_name</td> <td>Optional</td> <td>Name of the study. This can be omitted, and all users the API caller has rights to are returned</td> </tr> <tr> <td>user_names</td> <td>Optional</td> <td>List specific users to return, the user name in <user>@<domain>.com format.. Separate multiple by comma</td> </tr> <tr> <td>limit</td> <td>Optional</td> <td>Pagination API - different limit from the default 1000 can be used</td> </tr> <tr> <td>offset</td> <td>Optional</td> <td>Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd</td> </tr> </tbody> </table>	Name	Req/Opt	Notes	study_name	Optional	Name of the study. This can be omitted, and all users the API caller has rights to are returned	user_names	Optional	List specific users to return, the user name in <user>@<domain>.com format.. Separate multiple by comma	limit	Optional	Pagination API - different limit from the default 1000 can be used	offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd
Name	Req/Opt	Notes														
study_name	Optional	Name of the study. This can be omitted, and all users the API caller has rights to are returned														
user_names	Optional	List specific users to return, the user name in <user>@<domain>.com format.. Separate multiple by comma														
limit	Optional	Pagination API - different limit from the default 1000 can be used														
offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd														
Notes	<ul style="list-style-type: none"> • User to retrieve information about users in the vault as they relate to studies in the vault • The top level of each user / entry returned is Vault account properties. An interior section of the return is itself a JSON array of study access that the user has rights for. • The return will include all vault owners since those users are on every study. • Refer to the Return Parameter Notes table after the examples for detailed information on each property. 															

Examples

Description / Request (URL)	Response
	<pre> { "study_environment": "Labrinone3_DEV1", "study_role": "CDMS Lead Data Manager", "study_access": "Enabled", "site_access": "", "country_access": "", "lms_training_status": "", "ignore_lms_training_status": false }, { "study_environment": "Labrinone4_DEV1", "study_role": "CDMS Lead Data Manager", "study_access": "Enabled", "all_sites_access": true, "lms_training_status": "", "ignore_lms_training_status": false }] } </pre>

Return Parameter Notes

Location	Type	Notes
responseStatus	String	
responseDetails	Section	
responseStatus/limit	Integer	When paging involved, the limit of each return
responseStatus/offset	Integer	When paging involved, the offset of the current return
responseStatus/size	Integer	The size of the current return
responseStatus/total	Integer	The total (outside of any paging) of the query
vault_id	Integer	The Vault ID
users	Array	An entry per user of the return
users/user_id	String	Value is across all vaults / domains
users/user_name	String	E.g. eric.emerton@eke.com
users/user_email	String	
users/user_title	String	
users/user_last_name	String	

Location	Type	Notes
users/user_first_name	String	
users/company	String	
users/federated_id	String	This value is the user name in a system the user is using SSO for to login to the vault. The security policy must be set appropriately for this value to line up. (multiple SSO policies can reside in one vault)
users/user_language	String	E.g. en, fr, de, etc.
users/user_locale	String	E.g. en_US, en_AU, etc.
users/user_timezone	String	Full label of the user's timezone
users/security_policy	String	The security policy name value
users/activation_date	String (as Date)	If there is an activation date, shown as yyyy-MM-dd format. Otherwise omitted
users/created_date	String	Format yyyy-MM-ddThh:ss:mmZ, UTC date time
users/last_modified_date	String	Format yyyy-MM-ddThh:ss:mmZ, UTC date time
users/principal_investigator	Boolean	When choosing 'Add as Principal Investigator' from the UI, a user can also be a PI for tagging to a specific site.
users/active	Boolean	I.e. if the user is active in the vault (no specific study)
users/vault_owner	Boolean	If the user is a vault owner, they have access to all studies (need no specific study access). These users returned will not have a user/studies JSON array of entries
users/all_studies_access	Boolean	When it is true access to all existing and future studies of the vault
users/studies	Array node	Vault owner users have this omitted , i.e. since access to all studies is implied
users/studies/study_environment	String	The Study Instance label, e.g. ABC-2022-01_DEV1
users/studies/study_role	String	The study role name, i.e. 'for that study'
users/studies/study_access	String	Values of Enabled or Disabled
users/studies/all_sites_access	Boolean	When true , the user has access to all sites. If false , omitted from return.
users/studies/site_access	String	Comma list of sites the user has access to
users/studies/country_access	String	Comma list of study counties for the user, if not specific site access. That is, the sites of those countries.
users/studies/lms_training_status	String	Values are empty, Trained or Not Trained
users/studies/ignore_lms_training_status	Boolean	When this value is true , the LMS training status on that study is ignored. That is, the user is allowed into the study per this flag

13.2 Upload Users

Help Main	https://developer-cdms.veevavault.com/api/22.2/#upload-users									
Style	PUT									
Endpoint	<your Vault URL>/api/v22.2/app/cdm/users									
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>import_file</td> <td>Required</td> <td>CSV file. Name	Req/Opt	Notes								
import_file	Required	CSV file. Includes header line, and a row per user to action on. One line can be multiple studies (e.g UAT vault). See CDMS Help for full details on the structure of the file, plus latest template								
append_study_country_access	Optional									
Notes	<ul style="list-style-type: none"> This endpoint is used to create or update users Each row is a user to make updates (or create) See CDMS Help for full details on the structure of the file, plus latest template For deactivation at a study level, the endpoint is used with specific 'Disabled' value in the Study Access column. Vault or domain activation or deactivation - see the next few sections The CSV attempted is checked for: <ul style="list-style-type: none"> Correct column header names Values in each cell that comply with checks If ANY of the rows fail, the return response will enumerate those rows with issues. No job starts in such cases WARNING: The CSV template can change from release to release as new properties are introduced. If some of the new properties are required, this could upend existing built integrations. The API version does NOT refer back and use older CSV templates. Consult the documentation and experiment in pre release vaults on coming releases Once a job successful starts, the job ID is returned, and this endpoint: <p><your Vault URL>/api/v22.2/services/jobs/{job_id}</p> <p>.. can be used to check for the status of the job. Once the job completes, consider using Retrieve Users to verify the state of each of the users created and/or updated.</p>									

Examples

Description / Request (URL)	Response
CSV attempted is valid, job starts	
<pre>https://{{vaultDNS}}/api/v22.2/app/cdm/users?append_study_country_access=false</pre> <p>(with content/type = text/csv and file passed in import_file parameter)</p>	<pre>{ "responseStatus": "SUCCESS", "response": { "job_type": "EDC Import", "job_id": 446208, "status": "Queued", "created_by": "user.admin@username.com", "created_date": "2021-08-16T12:14:42Z"</pre>

Description / Request (URL)	Response
	<pre> } } </pre>
<p>Attempt where there are issues in the CSV</p>	
<pre> https://{{vaultDNS}}/api/v22.2/ app/cdm/users?append_study_coun try_access=false (with content/type = text/csv and file passed in import_file parameter) </pre>	<pre> { "responseStatus": "FAILURE", "responseDetails": { "rows": 1, "ready": 0, "warning": 0, "error": 1, "limit": 100 }, "errors": [{ "errorMessage": "Error: Ignore LMS Status [Maybe] does not exist, Study Access [Enabledd] does not exist, Role [CDMS Principal Investigatorr] does not exist", "User Name": "test_api_1@eke.com", "Study Role": "CDMS Principal Investigatorr", "Ignore LMS Status": "Maybe", "Study Access": "Enabledd" }] } </pre>

13.3 Inactivate User – Vault or Domain Level

Help Main	https://developer-cdms.veevavault.com/api/22.2/#inactivate-user									
Style	DELETE									
Endpoint	<your Vault URL>/api/v22.2/objects/users/{user_id}									
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>user_id</td> <td>Required</td> <td>The Vault user ID.</td> </tr> <tr> <td>domain</td> <td>Optional</td> <td>URL parameter, true/false. When omitted the default is false.</td> </tr> </tbody> </table>	Name	Req/Opt	Notes	user_id	Required	The Vault user ID.	domain	Optional	URL parameter, true/false. When omitted the default is false.
Name	Req/Opt	Notes								
user_id	Required	The Vault user ID.								
domain	Optional	URL parameter, true/false. When omitted the default is false.								
Notes	<ul style="list-style-type: none"> • Use this endpoint ONLY to inactivate a user account, vault or domain wise • For the deactivation of just a specific study, use the Upload Users endpoint, but with a line for the user indicating a Disabled status. • WARNING: This endpoint with domain=true will inactivate the user across ALL vaults they otherwise have access into. The use of domain=false will inactivate the user in just the vault targeted. (all studies in that vault). • TIP: Later a user can be reactivated. Consider leaving a user's study access intact, so that a simple reactivation later can return the user to all appropriate study access rights. 									

Examples

Description / Request (URL)	Response
Inactivate successful - just the target vault	
..api/v22.2/objects/users/1234567	<pre>{ "responseStatus": "SUCCESS", "id": 1234567 }</pre>
Inactivate successful - domain level (ALL vaults on that domain)	
..api/v22.2/objects/users/1234567?domain=true	<pre>{ "responseStatus": "SUCCESS", "id": 1234567 }</pre>
Bad User ID	
..api/v22.2/objects/users/1234599	<pre>{ "responseStatus": "FAILURE", "errors": [{ "type": "INVALID_DATA", "message": "User [1234599] not found" }] }</pre>

Notes	<ul style="list-style-type: none"> Use this endpoint ONLY to activate a user account that is currently inactive on a specific vault, and the account is to be activated on that vault only. This action must be performed first, prior to specific study activations (where necessary) 												

Examples

Description / Request (URL)	Response
Active on vault successful ..api/v22.2/objects/users/1234567/vault_membership/10043299 (with encoded parameter parameter active__v = true)	<pre>{ "responseStatus": "SUCCESS" }</pre>
Bad User ID ..api/v22.2/objects/users/1234599/vault_membership/10043299	<pre>{ "responseStatus": "FAILURE", "errors": [{ "type": "INVALID_DATA", "message": "User [1234599] not found" }] }</pre>

14 Study Design

14.1 Design Overview

The study design endpoints started at release **22R2**, and additional will be released going forward. The primary use case is for programmatic parsing of a study's design, similar to CDISC ODM **xml** files. The plan for Vault CDMS is to release APIs that can retrieve that similar representation of a study's design, by casebook version (file per), but initially in JSON file format (Vault platform's primary format).

Studies are designed using design level components that mirror the data levels:

- **Casebook Version Definition**
- .. then.. -> **Event Group Definition**
- .. then.. -> **Event Definition**
- .. then.. -> **Form Definition**
- .. then.. -> **Item Group Definition**
- .. then.. -> **Item Definition**
- ...then.. -> Codelist / Unit Codelist Definitions (used by dropdown Item definitions)

Each casebook version yields a schedule of these components, i.e. what is in use at the various levels. Properties like 'repeating', labels, short labels, etc. (seen in the Studio SDS) are included at all levels.

Currently, the Vault CDMS Studio module allows for export of a Study Design Specification (SDS), plus annotated workbooks PDFs - by casebook version. The SDS is an Excel workbook and could be parsed for all the same design information, but programmatic retrieval of these is not possible, and studies get amendments / new casebook versions often. Further, the programmatic parsing of Excel workbooks can be risky as compared to the same information in JSON (or XML) format.

14.2 Retrieve Casebook Versions

Similar to the online help, this is noted here only as a pointer to the existing **Studies** -> [Retrieve Studies](#) endpoint. As of 22R2 release, it includes the casebook definitions in the study..

14.3 Retrieve Coding Definitions

Help Main	https://developer-cdms.veevavault.com/api/22.2/#retrieve-coding-form-definitions														
Style	GET														
Endpoint	<your Vault URL>/api/v22.2/app/cdm/coder/forms														
Parameters	<table border="1"> <thead> <tr> <th>Name</th> <th>Req/Opt</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>study_name</td> <td>Optional</td> <td>Name of the study. This can be omitted, and all users the API caller has rights to are returned</td> </tr> <tr> <td>limit</td> <td>Optional</td> <td>Pagination API - different limit from the default 1000 can be used</td> </tr> <tr> <td>offset</td> <td>Optional</td> <td>Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd</td> </tr> </tbody> </table>			Name	Req/Opt	Notes	study_name	Optional	Name of the study. This can be omitted, and all users the API caller has rights to are returned	limit	Optional	Pagination API - different limit from the default 1000 can be used	offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd
Name	Req/Opt	Notes													
study_name	Optional	Name of the study. This can be omitted, and all users the API caller has rights to are returned													
limit	Optional	Pagination API - different limit from the default 1000 can be used													
offset	Optional	Pagination API - the offset of the current page, if the response is to cross multiple pages. Example: 1750 records in query, 0 thru 999 (zero based index) in 1st 'page', then 1000 to 1749 in the 2nd													
Notes	<ul style="list-style-type: none"> Used to retrieve the list of medical coding forms, i.e. those tagged to use Vault CDMS Coder. Medical coding requests are added on the submit of such forms The coding definition includes the item definition being coded (e.g. AE verbatim, DM drug name), plus other properties from the form (if the study design maps them) With this information, one can then use the response information to obtain information from the Medical Coding requests and queries of the study, that is, 'of' that definition. WARNING: Regarding parameter names from definition response vs. usage in other endpoints: <ul style="list-style-type: none"> The value of the definition response (this endpoint) for: <code>coding_item_definition_name</code> .. is in turn used as the parameter into the Medical Coding -> Retrieve Coding Requests endpoint to get requests of that definition, specifically, its parameter: <code>coding_item_definition</code> The value of this definition response (this endpoint) for: <code>coding_item_definition_id</code> ... is in turn used to as the parameter into the Medical Coding -> Retrieve Coding Queries endpoint to get queries added against medical coding requests of that definition, specifically: <code>coding_item_definition</code> A future release is likely to change these parameter names (retrieve coding requests / queries) to be consistent, but still honor old/new naming.

<p data-bbox="74 331 545 363">Get Coding Form Definitions of a Study</p> <pre data-bbox="74 394 716 453">.../api/v22.2/app/cdm/coder/forms?study_name=ABCP-2022-01_DEV1</pre>	<pre data-bbox="784 394 1502 1703"> { "responseStatus": "SUCCESS", "responseDetails": { "limit": 1000, "offset": 0, "size": 3, "total": 3 }, "forms": [{ "form_name": "AE", "form_type": "ae_v", "form_definition_status": "active_v", "form_coding_status": "active_v", "dictionary_definition": "MedDRA", "coding_item_definition_id": "V0T000000002001", "coding_item_definition_name": "VV-000004" }, { "form_name": "MULTI_CODING", "form_type": "other_v", "form_type_other_label": "My Other Label Here", "form_definition_status": "active_v", "form_coding_status": "active_v", "dictionary_definition": "MedDRA", "coding_item_definition_id": "V0T000000003001", "coding_item_definition_name": "VV-000005" }, { "form_name": "Concomitant-Medication", "form_type": "conmed_v", "form_definition_status": "active_v", "form_coding_status": "active_v", "dictionary_definition": "WHODrug C3", "coding_item_definition_id": "V0T000000004001", "coding_item_definition_name": "VV-000006" }] } </pre>

15 Best Practices / Tips

Area	Best Practice
Error Detection	<p>Watch the ‘inner’ vs. ‘outer’ success/fail statuses in API response. The Vault API is designed such that most API endpoints all multiple actions of that type in the same call. As such, the status of each entry in the request is embedded at the inner level. The outer responseStatus is largely an indication that ‘yes, you reached the server, and it performed an action’. The example below is the attempt to add two event groups, where one succeeds, one fails. Note the inner responseStatus for each, with overall outer responseStatus</p> <pre data-bbox="386 646 1266 1402"> { "responseStatus": "SUCCESS", "eventgroups": [{ "responseStatus": "SUCCESS", "study_country": "United States", "site": "101", "subject": "101-001", "eventgroup_name": "egIRT_INFO", "eventgroup_sequence": 1 }, { "responseStatus": "FAILURE", "errorMessage": "[Subject] with name [101-021] not found", "study_country": "United States", "site": "101", "subject": "101-021", "eventgroup_name": "egIRT_INFO" }] } </pre>
Error Detection	<p>If creating an integration into Vault CDMS, what is your error detection overall strategy?</p> <ul data-bbox="435 1520 1510 1724" style="list-style-type: none"> ● Do you examine each response for success before moving on to a sequential / next call ● What sort of alerting / process kicks off when there is an error? How do you avoid things falling through the cracks? ● What about the mistake / update scenarios? What happens when your source data changes, mistake or otherwise, how do you push the data in, where an update might have a different course of action from the initial add?

Area	Best Practice
Study Design	For an inbound integration to Vault CDMS: <ul style="list-style-type: none"> ● If possible, avoid form designs that involve both user entered data and integrated data. ● If the data is semi-consistent from the upstream system from Vault CDMS, consider a template of forms, 100% read only that can be reused study to study.
Study Design	A repeating visit in Vault CDMS increments the eventgroup_sequence values (1, 2, .. etc). Although there is an event_sequence property, current system design yields that as a 1 , always. The event group level is used for both single repeating events (e.g. Unscheduled), or series of events (e.g. Day 1, Day 8, Day 15.. but by Cycle)
API Account	Try to follow a path for the API account with a Vault Security Policy with setting 'No Password Expiration'. In this way, a recurring integration is not at risk of having an expired password upend the push or pull of important information.
API Account	An API user is no different from any other study user. Typically, users must go through / pass a training before their study access is truly enabled. For an API / system user, ensure to check the Ignore LMS Status, Assume Trained attribute on the account (typically). Otherwise the API user won't find the study (or studies) intended. The action is not necessary if the specific Vault is not activated to required LMS training before study access is granted.
Inspecting Data	Strive to inspect the existing forms / events before attempting an action to push data into the study. Does the subject even exist? Does the target area of data (form, event group, etc) exist?
Inspecting Data	If a form is submitted, it must first be opened for edit via the Edit Submitted Form API endpoint, Edit Form (later section), before proceeding with the update of data. Currently there is no parameter to allow for conditional open for edit, during the call to update data on a form, not a parameter to additionally submit the form once data is updated/added.
Create vs Upsert	Various API endpoints started as specific create actions, with later PUT versions performing an upsert of the entity (event group, form, item group, etc). The upsert option is a better option, since specific sequences can be indicated at the various design levels, with the result being either an add (if does not exist) or a skipped action. Update '2nd time in' scenarios benefit from this approach as the same sequence of API calls can typically be used.
Sequences	The various design levels of a study - event group, form, item group - can repeat, or not repeat. When the do not repeat the Create / Upsert endpoints do not require the specific indication of, say: : "eventgroup._sequence": 1 : in the request body. That said, consider always including these regardless, as it makes for a more consistent request/response match

Area	Best Practice																																
Locked / Frozen	<p>Various levels of locked and frozen statuses in turn affect ability to push data into Vault CDMS:</p> <table border="1" data-bbox="386 342 1523 749"> <thead> <tr> <th>Area</th> <th>Status</th> <th>Add/Update Data</th> <th>Add/Update Queries</th> </tr> </thead> <tbody> <tr> <td>Study</td> <td>Locked</td> <td>Disallowed</td> <td>Disallowed</td> </tr> <tr> <td>Site</td> <td>Locked</td> <td>Disallowed</td> <td>Disallowed</td> </tr> <tr> <td>Subject</td> <td>Locked</td> <td>Disallowed</td> <td>Disallowed</td> </tr> <tr> <td>Event</td> <td>Locked</td> <td>Disallowed</td> <td>Disallowed</td> </tr> <tr> <td>Event</td> <td>Frozen</td> <td>Disallowed (event date changes)</td> <td>Allowed (on event date)</td> </tr> <tr> <td>Form</td> <td>Locked</td> <td>Disallowed</td> <td>Disallowed</td> </tr> <tr> <td>Form</td> <td>Frozen</td> <td>Disallowed</td> <td>Allowed</td> </tr> </tbody> </table> <p>Frozen and Locked are not automatable through the API, by design. These were/are human decisions to stop actions from happening.</p>	Area	Status	Add/Update Data	Add/Update Queries	Study	Locked	Disallowed	Disallowed	Site	Locked	Disallowed	Disallowed	Subject	Locked	Disallowed	Disallowed	Event	Locked	Disallowed	Disallowed	Event	Frozen	Disallowed (event date changes)	Allowed (on event date)	Form	Locked	Disallowed	Disallowed	Form	Frozen	Disallowed	Allowed
Area	Status	Add/Update Data	Add/Update Queries																														
Study	Locked	Disallowed	Disallowed																														
Site	Locked	Disallowed	Disallowed																														
Subject	Locked	Disallowed	Disallowed																														
Event	Locked	Disallowed	Disallowed																														
Event	Frozen	Disallowed (event date changes)	Allowed (on event date)																														
Form	Locked	Disallowed	Disallowed																														
Form	Frozen	Disallowed	Allowed																														
Change Reasons	<p>For the update of a form data, a change reason is only used when there is an update/change to existing values, after there has been at least one submit of the form. Change reasons can be included for the initial set of data, but they are ignored, instead the default ‘changes before submission’ is used. That said, it is easier to send your change reason with all form updates. In this way you don’t have to track necessarily that it’s the 1st or later touch of the form data.</p>																																
Jobs	<p>The Vault CDMS job types that allow start / inspect / retrieve output follow the Vault platform job flow. That is, a job of Completed status might not necessarily not have had any issues. Depending on the job type, more detailed log style information is usually included in the output. Both the Vault job log and the content of the job’s output should be inspected.</p>																																
User Administration	<p>For updating of users with a CDMS vault, ensure the proper usage depending on the need:</p> <ol style="list-style-type: none"> (1) For full deactivation of an account, this will remove the user from all vaults (thus all studies in those vaults) on that domain. Reactivation of an account is later (if needed) a two step process. (update of domain status, then update of vault memberships) (2) For deactivation of an account at the vault level, this will remove the user from any studies they otherwise would have had access to, in that vault (3) For study access deactivation -> use the upload users endpoint, with a line indicating Study Status = Disabled, to remove access to a single study. Specific site / country access does not need to be removed, as later a re-activation in the study might happen, returning the user to the state they were at deactivation in the study. 																																
User Administration	<p>The add/update of users in the vault involves the pass of a CSV of user information in the same way as the Vault CDMS Users UI. The CSV template can change from release to release as new properties are introduced. If some of the new properties are required, this could upend existing built integrations. The API version does NOT refer back and use older CSV templates. Consult the CDMS Help and experiment in pre release vaults on coming releases when writing user administration integrations.</p>
